First Wuhan Coronavirus Patient Identified in the United States

A person in Washington State is infected with a new respiratory virus. The outbreak began at a market in China and now has spread to at least four other countries.

<image001.jpg>

The outbreak, which has infected nearly 300 people in mainland China, began in a seafood and poultry market in Wuhan, central China. Credit...EPA, via Shutterstock

<image002.png>

By [Roni Caryn Rabin](#)

- • A person in Washington State is infected with the Wuhan coronavirus, the first confirmed case in the United States of a mysterious respiratory infection that has killed at least six people and sickened hundreds more in Asia.

The patient, who was hospitalized with pneumonia last week, recently had traveled to Wuhan, China, where the outbreak appears to have originated, federal officials have found.

Investigators tested samples from the patient for the presence of the virus; positive results were received over the weekend. Officials declined to identify the patient, who was said to be quite ill. News of the first case in the United States comes amid growing evidence that the virus spreads from person to person, although it is not clear how easily.

The outbreak, which began in a seafood and poultry market in Wuhan, a city of 11 million, is spreading: Patients have been identified in Beijing, Shanghai and Shenzhen, as well as Taiwan, Japan, Thailand and South Korea.

On Tuesday, Chinese authorities confirmed that six people have died of the infection in Wuhan. Nearly 300 cases have been reported to date in China. Many of the patients lived in or traveled to Wuhan. The World Health Organization will meet tomorrow to decide whether to declare the outbreak an international public health emergency. But information about the new virus is still thin, and it's not clear whether or how many Americans are at risk.

[\[Like the Science Times page on Facebook.\]](#) | [Sign up for the Science Times newsletter.](#)]

"There are still more questions that we don't know the answers to than things we do know," said Dr. William Schaffner, a professor of preventive medicine and infectious diseases at Vanderbilt University Medical Center in Nashville.

"For example, what is the source? We don't know exactly. The location likely was the live animal market, but we don't know the particular animal."

The more pressing and urgent question, he said: "How frequent is human to human transmission?" In one instance a patient appears to have infected 14 health care workers in a medical facility, but that individual may have been a "super-spreader," he said. "Could people with mild infections transmit this virus from person to person? That all remains still under investigation."

On Monday, Vanderbilt University Medical Center in Nashville changed its electronic prompts so that any patients coming in to its hospital, emergency room or clinics with a fever or respiratory symptoms will be asked whether they have been to China recently or have had contact with anyone who has recently traveled to China.

Hospitals around the country are likely taking similar steps, Dr. Schaffner said, in an effort to quickly identify infected patients and place them in isolation so they can be cared for safely by hospital workers, and so specimens can be collected for testing.

Dr. Schaffner cautioned anyone traveling to China to avoid visiting live animal markets and to keep a distance from all live animals, including domesticated farm animals. Travelers to China should practice [lots of good hand hygiene](#), he added, and do their best to avoid anyone who is coughing or sneezing.

DMID and Mike Busch are organizing a systematic approach to providing samples for assays standardization and controls. I think it would be best to coordinate with that process. I'm sure we can find a few local samples in the meantime to bridge.

To: "Graham, Barney (NIH/VRC) [E]" <(b) (6)>
Subject: **COVID-19 Vaccine: Proposal & Inquiry**

Hi Dr. Graham

My name is Chad Moles, and I'm the CSO of [Humane Genomics](#) a biotech company focused on developing synthetic viruses as personalized therapeutics. You may not recall, but we met briefly at ASV 2018 at the University of Maryland. I enjoyed your discussion and thoughts on synthetic vaccinology.

Related to this, my company and I came up with a **proposal for a COVID-19 vaccine**. We aim to develop vesicular stomatitis virus (VSV) engineered with the spike glycoprotein of SARS-CoV-2. You can read more about it in the attached slide deck, or on our blog [here](#) and [here](#). Of note, we received SARS-CoV-2 gene fragments today and plan to complete whole-genome assembly by Friday, bringing the design and build of vaccine candidates to 10 days.

I know you are currently collaborating with Moderna on their mRNA vaccine, but I would love to get your feedback on our vaccine proposal and learn more about how we can collaborate with government or advance our testing capabilities.

It would be great if we could setup a brief call to discuss.

Best regards,

Chad

Dear Jason and Barney,

A sequence of the Wuhan CoV is now out. (b) (4)

Would you have some time later today (Jan 13) or tomorrow at 17.00h (NIH time 11.00h, Tex time 10.00h) for a brief Skype to discuss the possible options for prioritizing experiments that may or may not be included in the draft manuscript that Daniel and Dorien have been working on?

Thanks and kind regards,
Xavier

Chicago Couple With Coronavirus Discharged From Hospital, Release Statement

Published 44 mins ago • Updated 43 mins ago

NBCUniversal, Inc.

A husband whose wife is being treated for coronavirus is now facing the same illness at a Hoffman Estates hospital. NBC 5's Lexi Sutter has the story.

The Chicago couple diagnosed with the coronavirus last month have been discharged from the hospital and made their first public comments on the ordeal, health officials said Friday.

The two patients - a husband and wife, both in their 60s - were released to their home "under the guidance of the Centers for Disease Control and Prevention and the Illinois Department of Public Health," a spokesman for AMITA Health said in a statement.

The patients were previously being treated at AMITA Health's St. Alexius Medical Center in Hoffman Estates. The pair also released their first statement on the ordeal Friday.

"With it being an uncomfortable situation, the care and the services we've received have been great," the couple said in a joint statement released by AMITA Health. "Everyone's been very kind and very respectful. This has been the best healthcare experience we've ever had, but we're definitely looking forward to getting home and getting life back to normal."

The couple requested privacy in their transition to home isolation, health officials said.

The woman was the second person diagnosed with the virus in the U.S., health officials announced on Jan. 24. She returned from Wuhan, China - the epicenter of a recent outbreak - on Jan. 13 and was later hospitalized, a state epidemiologist with the Illinois Department of Public Health said in announcing the diagnosis last month.

On Jan. 30, the CDC announced that her husband tested positive for the virus, marking the first instance of person-to-person spread in the U.S.

He had "close contact" with his wife and reported symptoms, health officials said. He was admitted to an area hospital on Jan. 28, the IDPH said, where his condition was stabilized.

"This may be concerning, but based on what we know now, our assessment remains that the immediate risk to the American public is low," Robert Redfield of the CDC said after the man was diagnosed.

Hi Barney and Kizzmekia,

Peter Loftus from the WSJ spoke to Dr. Fauci last month on campus and was not able to connect with the two of you because you were both offsite that day. He has circled back around and would like to speak to one of you for a print story and cover the following:
how mRNA-1273 works and how it was designed

Would one of you be able to help? Peter would like to interview on the phone before COB Monday and he is available over the weekend. It was offered to Dr. Fauci and he deferred to VRC. Three related WSJ stories are attached as background.

Best,
Nissa

Hi Barney,

Closing the loop on this podcast request. Dr. Fauci will do the Wednesday interview and the podcaster will not visit building 40. Thanks for sharing your availability. Should he have follow up questions I'll let this group know.

Hope you have a good conference at Fisher's Lane.

Best,
Nissa

Hi Barney,

Peter Loftus with the Wall Street Journal will interview Dr. Fauci on Wednesday, Feb. 19 at NIH. He'd also like to speak to you about coronavirus vaccine research while he's oncampus.

If you are interested in this request, do you have time on Wednesday either before or after Dr. Fauci's 1:30-2 PM interview? Peter would walk over to Building 40 from 31 or vice versa depending on timing so he should probably wrap up at Building 40 by 1 or arrive at Building 40 at 230 on the earliest side of that window.

Thank you and hope you are doing well!

Best,
Nissa

Hi Dr. Graham:

I'm a reporter at FiveThirtyEight working on a story about the regular seasonal influenza this year and how it has interacted with the COVID-19 outbreak. I was wondering if you might be free for a brief phone interview early next week to go over what we know about how the seasonal flu had been progressing prior to COVID-19 and how the new coronavirus complicates monitoring and controlling seasonal flu.

Please let me know if we can arrange a time to chat.

Kind regards,
Kaleigh

Subject: Greetings from (b) (6) NIAID Response to COVID-19

Dear Kizzmekia,

My name is (b) (6). I wanted to send my warmest congratulations on the work you been doing and say how proud we are of how you've been representing. Keep it up!

I also am writing to get your help and guidance. My colleagues (scientists) and I have been thinking of ways to assist in this crisis. I received the message (below) from a good friend and researcher in Boston. Do you know if NIAID would accept this type of information? Or, perhaps the communications department?

Certainly, there are many aspects of federal operations and response that make it different from the state level. But, I was wondering if NIH would accept this voluntary information of people with relevant skills that want to help, and if there was a particular department that would handle it. There may be other initiatives you're of that may be more suitable. Any guidance would be appreciated.

Be Well,

(b) (6)

National Science Foundation
10400A (b) (6)

Hey I made a google form and more than 6,000 people responded and now I need to get it into the hands of decision makers. Know anyone at NSF who is trying to get their hands on this info? We have a few states using the database, but nothing yet at the federal level.

Hi Stephane,

I've been advised by the Ethics office not to participate in this. I think before January 10th it was not so complicated, but with the active licensing and other activities it is viewed as unadvisable.

Sorry about that. Probably best if I focus on the task at hand anyway.

Take care,

Barney

Hi Barney,

Great to e-meet you. Thank you so much for your participation. Below is the invite with details for the event.

An outline of the topics to cover on MERS preclinical and SARS-CoV-2 is below. If you can share slides for your part of presentation by April 1st that would be great. Also just in case, you end up having other commitments on April 14th, the day of our Vaccines Day event, can I suggest that we do record you beforehand? We would only need your voice-over to your slides and we can play it during your segment with the slides (there won't be video). If you are okay with that, I can work with you on setting up a day for a recording the week of April 6th. How does that sound?

Topic:

(b) (4)

Here is the invite with details as well.

Do you think there is any chance that we reversed the IgG1 and IgG2a results. It seems very odd to me especially in the C57 that there is virtually no IgG2a response, and this is a more Th1 oriented strain than BALB/c. Is there a way to check and be sure. This just doesn't seem right.

On Mar 26, 2020, at 4:40 PM, Chad Moles (b) (6) wrote:

Hi Dr. Graham

My name is Chad Moles, and I'm the CSO of [Humane Genomics](#) a biotech company focused on developing synthetic viruses as personalized therapeutics. You may not recall, but we met briefly at ASV 2018 at the University of Maryland. I enjoyed your discussion and thoughts on synthetic vaccinology.

Related to this, my company and I came up with a **proposal for a COVID-19 vaccine**. We aim to develop vesicular stomatitis virus (VSV) engineered with the spike glycoprotein of SARS-CoV-2. You can read more about it in the attached slide deck, or on our blog [here](#) and [here](#). Of note, we received SARS-CoV-2 gene fragments today and plan to complete whole-genome assembly by Friday, bringing the design and build of vaccine candidates to 10 days.

I know you are currently collaborating with Moderna on their mRNA vaccine, but I would love to get your feedback on our vaccine proposal and learn more about how we can collaborate with government or advance our testing capabilities.

It would be great if we could setup a brief call to discuss.

Best regards,

Chad

Subject: Fox News Radio Interview Request

Hello Dr. Graham,

My name is Siobhan Flattery I work at FOX News Radio in New York. I'm reaching out to see if you are available today to join our syndicated daily news show and popular podcast the FOX News Rundown to discuss the latest on the coronavirus, the WHO declaring the coronavirus outbreak a pandemic?

This will be a 10-15 minute, pre-taped, audio interview with our host Jessica Rosenthal. We can do interviews today until 5:30PM ET via skype (preferably) or landline. **Please no cellphone.**

The FOX News Rundown is a news-based weekday syndicated morning show and podcast hosted by FOX News Radio anchors, that offers a deep dive into the major and controversial stories of the day. We strive to offer contrasting perspectives that may not be heard elsewhere while going far beyond the basic headlines. Each weekday The FOX News Rundown features insight from top newsmakers, along with FOX News reporters and contributors, plus a daily commentary on a significant issue of the day.

(You can listen to previous podcasts by visiting: (<https://radio.foxnews.com/podcast/fox-news-rundown/>))

Please email – or call me at the number below if you have any further questions or to confirm a time for **today's** interview.

Thank you in advance,
Siobhan

Interesting that Skip Virgin also sent me this article late yesterday so I have read through it this am . Its really quite a decent article , in my opinion, and it appears to show that in the adoptive transfer studies of antibodies low doses of what is defined as neutralizing antibodies is associated with more cellular infiltration in the lower lungs which they almost solely characterize as macrophages but there is no staining of other cells e.g. T cells NK B cells etc. . So I think the data on the "causal issues" that its some alteration in macrophage dysfunction is less cogent not because the data are wrong but because other explanations are also quite plausible just not outlined or looked for.

(b) (5)

Thanks Emily .. kept me home in social mitigation for an hour this am!!

There are several studies in NHP, one I've seen showing a potential safety signal in NHP. I think others were equivocal or negative.

Anti-spike IgG causes severe acute lung injury by skewing macrophage responses during acute SARS-CoV infection -

Liu et al., 2019

<https://www.ncbi.nlm.nih.gov/pmc/articles/PMC6478436/>

- In SARS-CoV/monkey models, vaccine-induced S-specific immunity resulted in severe ALI in SARS-CoV infected Chinese macaques.

It is a very well done article. Informative. Nice quotes from you Emily. Complicated
We're any SARS vaccine trials done in NHPs.? Uses the same receptor. Guess I need to look up the
assays used in articles reporting coronavirus enhancement

As pressure for coronavirus vaccine mounts, scientists debate risks of accelerated testing

[Julie Steenhuisen](#)

10 Min Read

<image002.jpg>

CHICAGO (Reuters) - Drugmakers are working as quickly as possible to develop a vaccine to combat the rapidly spreading coronavirus that has infected more than 100,000 people worldwide.

FILE PHOTO: Nurse Jeff Gates processes a patient sample at a drive-through testing clinic for coronavirus, flu and RSV, currently by appointment for employees at UW Medical Center Northwest in Seattle, Washington, U.S. March 9, 2020. REUTERS/Lindsey Wasson

Behind the scenes, scientists and medical experts are concerned that rushing a vaccine could end up worsening the infection in some patients rather than preventing it.

Studies have suggested that coronavirus vaccines carry the risk of what is known as vaccine enhancement, where instead of protecting against infection, the vaccine can actually make the disease worse when a vaccinated person is infected with the virus. The mechanism that causes that risk is not

fully understood and is one of the stumbling blocks that has prevented the successful development of a coronavirus vaccine.

Normally, researchers would take months to test for the possibility of vaccine enhancement in animals. Given the urgency to stem the spread of the new coronavirus, some drugmakers are moving straight into small-scale human tests, without waiting for the completion of such animal tests.

"I understand the importance of accelerating timelines for vaccines in general, but from everything I know, this is not the vaccine to be doing it with," Dr Peter Hotez, dean of the National School of Tropical Medicine at Baylor College of Medicine, told Reuters.

Hotez worked on development of a vaccine for SARS (Severe Acute Respiratory Syndrome), the coronavirus behind a major 2003 outbreak, and found that some vaccinated animals developed more severe disease compared with unvaccinated animals when they were exposed to the virus.

"There is a risk of immune enhancement," said Hotez. "The way you reduce that risk is first you show it does not occur in laboratory animals."

Hotez testified last week before the U.S. House Committee on Science, Space and Technology about the need for sustained funding for vaccine research. There remains no vaccine for any of the new coronaviruses that have caused outbreaks in the past 20 years.

At least for now, the world's experts have concluded that accelerated testing is a risk worth taking.

At a specially convened World Health Organization (WHO) meeting in mid-February, designed to coordinate a global response to the new coronavirus, scientists representing government-funded research organizations and drugmakers around the world agreed that the threat was so great that vaccine developers should move quickly into human trials, before animal testing is completed, four people who attended the meeting told Reuters.

"You want to have a vaccine as quickly as possible," Dr Marie-Paule Kieny, former assistant director-general at the WHO, who co-chaired the meeting, told Reuters. "You have to balance this with the risk that you impose on a very small number of people, and do all you can do to mitigate this risk as much as possible."

The conclusion of that meeting, which was not open to media, has not been officially publicized by the WHO. It does not reflect any official position adopted by the WHO, a United Nations body whose job it is to help shape global health policy.

Regulatory oversight of drugmakers and medical research is in the hands of national regulators. The most powerful of those, the U.S. Food and Drug Administration (FDA), has signaled that it is in agreement with the consensus and will not stand in the way of accelerated testing schedules.

"When responding to an urgent public health situation such as novel coronavirus, we intend to exercise regulatory flexibility and consider all data relevant to a certain vaccine platform," FDA spokeswoman Stephanie Caccamo said in a statement. The agency had no comment specifically on animal testing for vaccine enhancement.

Coronavirus vaccine developers are still required to conduct routine animal testing to make sure the vaccine itself is not toxic and is likely to help the immune system respond to the virus.

SEATTLE RISK

Some 20 coronavirus vaccine candidates are being developed by research institutes and drugmakers including America's Johnson & Johnson and France's Sanofi SA. The U.S. government has earmarked more than \$3 billion for coronavirus treatments and vaccines.

Biotechnology company Moderna Inc, which is working with the U.S.-funded National Institutes of Health (NIH), is the closest to human testing, announcing plans to start a trial with 45 people in Seattle this month.

Testing for the specific risk of vaccine enhancement in animals will proceed simultaneously with human trials, the NIH told Reuters, which it said should establish whether it is safe to expose larger numbers of people to the vaccine. Moderna did not respond to requests for comment.

The plan is consistent with the WHO consensus and FDA requirements, said Dr Emily Erbelding, director of the Division of Microbiology and Infectious Diseases of the National Institute of Allergy and Infectious Diseases (NIAID), part of the NIH. The trial is expected to take 14 months, a spokeswoman for the NIH said.

Dr Gregory Poland, a virologist and vaccine researcher with the Mayo Clinic in Rochester, Minnesota, expressed doubts about that approach. "This is important, but it has to be done in a way that reassures scientists and the public that these (vaccines) are not only efficacious, but safe," he told Reuters. Hotez said he was surprised human trials were going ahead. "If there is immune enhancement in laboratory animals vaccinated with the Moderna vaccine, that's a showstopper," he said.

U.S. immunotherapy company Inovio Pharmaceuticals Inc, which is developing a coronavirus vaccine in collaboration with a Chinese company, also expects to start human clinical trials in 30 U.S. volunteers in April rather than wait for animal studies on vaccine enhancement.

"The community as a whole weighed that and said we don't want to delay the clinical process. We've been encouraged to go as rapidly as possible into Phase 1 studies," Inovio Chief Executive Joseph Kim told Reuters.

The company plans to start human safety trials shortly thereafter in China and South Korea - two countries that have been hit hard by the virus. Kim said he expects to have an answer to the question of vaccine enhancement at some point this year.

[Slideshow \(3 Images\)](#)

The Moderna/NIH trial is enrolling patients at the Kaiser Permanente Washington Health Research Institute in Seattle. The choice of location, made several weeks ago, could prove to be problematic. To reduce the risk to volunteers, scientists at the WHO meeting recommended that drugmakers restrict early clinical trials to small groups of healthy people and conduct them in places where the virus is not spreading, according to Kieny, who now works at French research institute Inserm. That lowers the chances that people who get the vaccine could encounter the virus and trigger a more severe reaction. Since the location was chosen, the Seattle metro area has emerged as the epicenter of infections in the United States. Washington state has reported 162 coronavirus infections and 22 deaths, out of a total of 755 infections and 26 deaths in the country as of Tuesday, according to a tally by Johns Hopkins University.

Nevertheless, Moderna and the NIH plan to go ahead.

"We think there is no reason to have to change the site. If you change it, there might be community transmission in another site over the next couple of weeks," Erbelding said. "Any risk of that to participants is very small. It would be manageable as the trial progresses. People are being observed very, very carefully."

EARLY WARNING SIGNS

Tragic lessons from other vaccines and prior work on coronaviruses have raised some warning flags for developers.

The best-known example occurred in a U.S. trial in the 1960s of a vaccine created by the NIH and licensed to Pfizer Inc to fight respiratory syncytial virus (RSV), which causes pneumonia in infants. The vast majority of babies who received the vaccine developed more severe disease, and two toddlers died. A more recent example occurred in the Philippines, where some 800,000 children were vaccinated with Sanofi's dengue vaccine, Dengvaxia. Only afterward did the company learn that it could increase the risk of more severe disease in a small percentage of individuals.

Research, including that conducted by Hotez, has shown that coronaviruses in particular have the potential to produce this kind of response. But testing for the risk of vaccine enhancement is time-consuming because it requires scientists to breed mice that are genetically altered to respond to the virus like humans. Work on these and other animal models is just getting under way in several laboratories around the world.

Moderna, Inovio and several other vaccine developers are not waiting for that process to be completed and are planning to launch human trials in record time for a virus that was only discovered in December.

Both Moderna and Inovio say their vaccines are likely to have a lower risk of vaccine enhancement because they are made using newer technology that focuses on specific genes on the outer 'spike' portion of the virus. Coronavirus vaccines that caused vaccine enhancement were typically made using an inactivated version of the entire virus. Neither company has produced a licensed vaccine to date. J&J said it is developing animal models to test for vaccine enhancement and hopes to have a vaccine candidate ready for human trials in October. A Sanofi spokeswoman said the company will examine this risk before testing the vaccine in clinical trials.

"People know how traumatic the RSV experience was," said Dr Johan Van Hoof, global head of Janssen Vaccines, J&J's vaccine unit. "When you see signals in animals like this, we should not ignore them."

Dear Kizzmekia,

My name is [REDACTED] (b) (6) I wanted to send my warmest congratulations on the work you been doing and say how proud we are of how you've been representing. Keep it up!

I also am writing to get your help and guidance. My colleagues (scientists) and I have been thinking of ways to assist in this crisis. I received the message (below) from a good friend and researcher in Boston. Do you know if NIAID would accept this type of information? Or, perhaps the communications department?

Certainly, there are many aspects of federal operations and response that make it different from the state level. But, I was wondering if NIH would accept this voluntary information of people with relevant skills that want to help, and if there was a particular department that would handle it. There may be other initiatives you're of that may be more suitable. Any guidance would be appreciated.

Be Well,

[REDACTED] (b) (6)

National Science Foundation

10400A [REDACTED] (b) (6)

Hey I made a google form and more than 6,000 people responded and now I need to get it into the hands of decision makers. Know anyone at NSF who is trying to get their hands on this info? We have a few states using the database, but nothing yet at the federal level.

Hi Barney,

I hope you are doing well.

To make sure we are getting reagents to you during this time, can you please answer the questions below?

- 1) Is your lab still operational?
- 2) Is your institution/company shut down and not receiving shipments?
- 3) Do you need your shipments sent to a different address because your receiving is not available?
- 4) If yes to #2 and #3 (your receiving is closed), and, you still require shipment to your lab, please follow these actions:

Provide detailed receiving instructions to both BioLegend and to the shipping carrier (e.g. FedEx):
FedEx US/Canada: 1.800.GoFedEx (1.800.463.3339).

If you opt in to use a non-standard delivery address, let me know and I'll send you a liability and delivery waiver to sign.

If you have any questions, please let me know. Thank you!

Best wishes,
Josh

Dear Cherry,

As you will have seen in the note from Dr. Sara Woodson, you can access these reagents from the BEI repository which is supported by NIAID. I noted that the question of a need for export license is being resolved. Hopefully this will be settled quickly. We will be happy to facilitate this access if you run into any challenges we can help with.

In addition, Dr. Barney Graham has offered to provide a small amount of (b) (4)
He suggests that THSTI should be able to re-create the CDC PCR.

Please feel free to reach out directly to Barney, Sara or Kimberly Stemple (JoJo) if you have any questions.

Also please let me know if I can be of further assistance.

Gray

Subject: Request for SARS-CoV2

Dear Gray,

I spoke with Dr. Renu Swarup yesterday and she asked me to reach out directly for reagents that we need for diagnostics for SARS-CoV-2 or COVID-19.

BEI has the virus grown by the CDC listed in its catalog as SARS-Related Coronavirus 2, Isolate USA-WA1/2020, NR-52281.

Is there someone who could help us with the process of getting the virus to India? If helpful, at THSTI, we have been through the agreements with NIAID for the dengue strains from Steve Whitehead. Have not received them yet, but I believe the paperwork is complete.

I know you will be very busy, but if (b) (6) or you could connect us to the right people, we can follow up.

Thanks and regards,

Cherry

Subject: Lab attendance and duties

Dear Lab,

You recently received emails from Dr. Collins and the VRC leadership about what to do during the looming coronavirus pandemic. Let me say a little more about what I expect from you. These are interesting and unprecedented times at least within my lifetime. We have to balance our own personal health against the public health and the functioning of the lab against the functioning of our families. I want this to work out well for everyone and for everyone to stay well. However, it is likely that some of us will eventually encounter the new coronavirus and if that happens we need to be mindful of our own health and the health of others around us. If you think you have been exposed or are developing symptoms, please stay home and contact me and seek medical help if needed.

Although we have been granted liberal telework options, it is important that we find a way to continue the coronavirus work.

(b) (5)

(b) (5)

(b) (5) If you have any

questions about what to do, please talk to the head of your group, either Tracy, Masaru, or Kizzy. You are also welcome to talk with me if needed.

I will be working off site for the next few days, and will be back in the office on Thursday. I am available by email and phone if needed.

Best wishes,

Barney

Subject: RE: NIH Moderna Vaccine Candidate Questions - Reply Required

Dear Ms. Mulach,

Thank you very much for the courtesy of a prompt and detailed response. It's always appreciated to get reply when engaging with our Government and these are not normal times so Thank You for address my questions/concerns.

I appreciate the detail in your reply with the mention of a number of vaccine candidates you indicate as under evaluation. I'm not sure what the status is of those evaluations so I'd like to focus on current singular US taxpayer investment of \$434 Million in the Moderna mRNA-1273 vaccine. You've indicated NIAID may have some indication of immune response on mice from a prior NIAID funded trial (still in Phase 1 as I seen reported by Moderna) with sufficient mice protection. This seems like pretty early days baseline data for the huge (\$434M) investment for a single option vaccine candidate – my risky “single shot at the goal” concern.

My concern has only been compounded today after seeing the just published results of another US Biotech company (Inovio Pharmaceuticals) for their MERS vaccine in Phase 2. You may be familiar with Inovio as they are the only other US company currently in human trials in the US (and Korea) for a Covid-19 vaccine. Today, Inovio published their MERS INO-4700 (GLS-5300) DNA vaccine demonstrates 100%

binding and 92% neutralizing antibody responses against MERS. Inovio's CoV- INO-4800 DNA vaccine for COVID-19 currently in Phase 1 trial utilizes identical strategy targeting Spike protein and CELLECTRA intradermal delivery. This is a STRONG human response to their MERS vaccine – not mice indications like the Moderna trial so heavily funded by the US Government/NIAID.

<http://ir.inovio.com/news-releases/news-releases-details/2020/INOVIO-and-GeneOne-Life-Science-Report-Positive-Phase-12a-Clinical-Data-With-DNA-Vaccine-INO-4700-for-MERS-Coronavirus-at-the-American-Society-of-Gene-Cell-Therapy-ASGCT-Conference/default.aspx>

Inovio's Covid vaccine is currently receiving funding from the Gates Foundation and CEPI. S. Korean government is funding a trial in S. Korea as well. My question for you and the NIH Director is why isn't the US Government also supporting this vaccine candidate that has shown such superior results?? This cannot be a one horse race for a vaccine and it also cannot be a 'who has NIAID worked with in the past' race for a vaccine. The stakes are too high for citizens live and our economy not to support ALL the options that have already shown solid results.

When can I expect to see my Government invest in a company that is already showing strong MERS Covid related results - like Inovio - to help drive for the vaccine we so critically need?? I look forward to seeing another prompt response.

Thank you in advance,
Sarah Anderson

Subject: RE: NIH Moderna Vaccine Candidate Questions - Reply Required

Dear Ms. Anderson,

Thank you for your recent message to staff at the National Institute of Allergy and Infectious Diseases. As the Director of the Office of Scientific Coordination and Program Operations in the Division of Microbiology and Infectious Diseases, I'm pleased to respond.

We very much appreciate you reaching out to NIAID with your questions about vaccines for COVID-19. NIAID scientists collaborated with the biotechnology company Moderna, Inc., to develop the investigational mRNA vaccine (mRNA-1273). The vaccine is currently being evaluated in a Phase 1 clinical trial: <https://clinicaltrials.gov/ct2/show/NCT04283461>. The trial is being funded by NIAID and conducted through the Institute's Infectious Diseases Clinical Research Consortium (IDCRC), a clinical trials network that encompasses NIAID's Vaccine and Treatment Evaluation Units (VTEUs). The Coalition for Epidemic Preparedness Innovations (CEPI) supported the manufacturing of the vaccine candidate for the Phase 1 clinical trial. The immunogenicity of mRNA-1273 has been tested in mice and was found to be similar to that of an mRNA vaccine previously tested for MERS (another coronavirus). That level of immune response was sufficient to protect mice from MERS CoV infection.

In addition to the mRNA vaccine, NIAID is evaluating multiple candidate vaccines for COVID-19, many of which utilize different technologies. For example, scientists at NIAID's Rocky Mountain Laboratories are working on a chimpanzee adenovirus-vectored vaccine, while NIAID-funded investigators are evaluating whether vaccines developed for SARS may be adapted for evaluation against SARS-CoV-2. For more information about NIAID's research on coronaviruses, including SARS-CoV-2, please see: <https://www.niaid.nih.gov/diseases-conditions/coronaviruses>.

NIAID also is working in partnership across government agencies to prioritize the preclinical and clinical testing for numerous other candidate vaccines. This includes collaboration with the Biomedical Advanced Research and Development Authority (BARDA), part of the Health and Human Services Office of the Assistant Secretary for Preparedness and Response (ASPR). BARDA is rapidly establishing partnerships to advance the development of vaccines, therapeutics, diagnostics, and other technologies for COVID-19. Information on those efforts can be found at:

<https://www.medicalcountermeasures.gov/app/barda/coronavirus/COVID19.aspx>. Finally, the National Institutes of Health and the Foundation for the National Institutes recently announced the Accelerating COVID-19 Therapeutic Interventions and Vaccines (ACTIV) partnership. ACTIV brings together more than a dozen leading biopharmaceutical companies, ASPR, the Centers for Disease Control and Prevention, the U.S. Food and Drug Administration and the European Medicines Agency to prioritize vaccine and drug candidates, streamline clinical trials, coordinate regulatory processes and leverage assets among all partners in response to the COVID-19 pandemic. For more information on ACTIV, including the partnership focus areas, please see: <https://www.nih.gov/news-events/news-releases/nih-launch-public-private-partnership-speed-covid-19-vaccine-treatment-options>.

Thank you again for contacting NIAID.

Sincerely,

Barbara Mulach

Subject: NIH Moderna Vaccine Candidate Questions - Reply Required

Dr Erbelding, Dr. Mascola and Dr Corbett,

Let me start by thanking each you for your service and your efforts to fast track a COVID19 vaccine – something we desperately need. THANK YOU!

As many Americans, I'm closely following those vaccine efforts to educate myself on the science and the taxpayer monies invested. Your NIH/Moderna mRNA vaccine has been heavily funded by the US Government (NIH & BARDA) and has a human trial underway. There's a lot of hope (especially by the NIH as it's the only COVID19 vaccine candidate currently NIH funded) for this vaccine. I share that hope as well so when I read this article with its detailed unbiased review of the vaccine and they raise a number of critical questions, I am disturbed both Moderna & the NIH failed to comment. Why is there no comment from the NIH on something this important?

<https://www.clinicaltrialsarena.com/comment/modernas-phase-i-covid-19-mrna-vaccine-has-manufacturing-edge-but-many-obstacles-to-confirm-protection-lay-ahead/>

Additional questions all Americans need answered are: Why is the NIH investing in a single COVID19 vaccine candidate? What is the science that supports the 'one shot at the goal' approach? Were there animal studies on this vaccine prior to human trials? If not, why not? There are a number of other vaccine candidates either in human trial now or ready to proceed now – why is the NIH using taxpayer funding only on a single COVID19 candidate – the Moderna vaccine?

This isn't a private investment decision as the NIH is responsible for the health of the American People and it's never been needed more than at this moment. I expect the NIH to respond to the questions raised by the above article, to be transparent to the American People about your vaccine efforts and to practice good science which doesn't prescribe to a 'one shot at the goal' approach. There are too many lives at risk for the NIH to do otherwise and those lives are responsible for your funding.

As a taxpayer providing your funding, I would appreciate (and actually expect) a reply to my questions. Thank you in advance.

Regards,
Sarah Anderson

Dear Barney,

Many thanks for your Perspective - this is great. I'm afraid that I do need you to add references please, a maximum of 15. I know this means picking references out of many, but I cannot proceed with your submission without them. Did you want to add a figure? You do not have to, but it might be helpful to explain some of the concepts in your piece. If you could send me a referenced version, I will get this to expedited review.

Thanks and best wishes,
Gemma

Subject: Coronavirus, animal model used in testing Moderna candidate vaccine

1. My understanding is that wild type mice are not susceptible to Covid-19 virus. What has been modified in the mice that will be used in the next in vivo step to make them susceptible to the virus?

After the 2003 SARS outbreak transgenic mice were made that express the human ACE2 gene to make them susceptible to infection.

- 2) Do those mice exist already and to what extent do we know how susceptible they are to the virus and what sorts of disease they show?

As noted, those mice exist and had been previously shared with Chinese investigators who have shown the mice can be infected with SARS-CoV-2. Those mice in the U.S. are being bred so that the colony can be enlarged.

3) When will those optimized challenge models be ready?

Those mice will be available for experiments within the next few weeks.

4) Will there be efficacy results from testing mRNA-1273 in optimized challenge models before clinical testing begins in April, as Dr. Fauci has stated it will?

Safety and product integrity are the primary criteria for starting a Phase 1 trials and mRNA has now been used in several clinical trials and shown to be safe and well tolerated. The immunogenicity of mRNA-1273 has been tested in mice and is similar to that of MERS CoV mRNA that has been previously tested. That level of immune response was sufficient to protect mice from MERS CoV infection.

Eric's piece on animal models from today: <https://www.statnews.com/2020/03/05/coronavirus-labs-scramble-to-find-right-animals-for-covid-19-studies/>

CEPI to fund three programmes to develop vaccines against the novel coronavirus, nCoV-2019

23 Jan 2020

By CEPI

Middle East Respiratory Syndrome virus particles. Image captured and color-enhanced. Credit: NIAID Share

OSLO, NORWAY. Jan 23, 2020 – CEPI, the Coalition for Epidemic Preparedness Innovations, today announced the initiation of three programmes to develop vaccines against the novel coronavirus, nCoV-2019.

The programmes will leverage rapid response platforms already supported by CEPI as well as a new partnership. The aim is to advance nCoV-2019 vaccine candidates into clinical testing as quickly as possible.

The nCoV-2019 vaccine development efforts will build on existing partnerships with Inovio (Nasdaq: INO) and The University of Queensland (located in Brisbane, Australia). In addition, CEPI today announces a new partnership with Moderna, Inc., (Nasdaq: MRNA) and the U.S. National Institute of Allergy and Infectious Diseases.

All of these are pioneering technologies designed to speed up the development of vaccines against emerging threats such as nCoV-2019.

“

Given the rapid global spread of the nCoV-2019 virus the world needs to act quickly and in unity to tackle this disease. Our intention with this work is to leverage our work on the MERS coronavirus and rapid response platforms to speed up vaccine development. There are no guarantees of success, but we hope this work could provide a significant and important step forward in developing a vaccine for this disease. Our aspiration with these technologies is to bring a new pathogen from gene sequence to clinical testing in 16 weeks – which is significantly shorter than where we are now.

Richard Hatchett

CEO of CEPI

The term “platform technology” broadly refers to systems that use the same basic components as a backbone but can be adapted for use against different pathogens as needed by inserting new genetic or protein sequences.

CEPI has moved with great urgency and in coordination with WHO, who is leading the development of a coordinated international response, to promote the development of new vaccines against the emerging threat of nCoV-2019. The novel coronavirus represents the first new epidemic disease of note to emerge since CEPI’s founding at Davos in 2017, with the express intent that it should be ready to respond to epidemics rapidly and effectively, wherever they emerge.

Inovio | DNA vaccine candidate against Middle East Respiratory Syndrome

CEPI announced a [partnering agreement](#), worth up to US\$56 million, with Inovio in April 2018, to advance DNA vaccine candidates against MERS and another of its priority diseases, Lassa fever, through to Phase 2.

Under the agreement, funding will support the development up to the end of Phase 2, providing clinical safety, immunological data, and the establishment of investigational stockpiles that will be ready for clinical efficacy trial testing during outbreaks.

The MERS DNA vaccine candidate is being developed using Inovio's DNA Medicines platform to deliver optimised synthetic antigenic genes into cells, where they are translated into protein antigens that activate an individual's immune system to generate robust targeted T cell and antibody responses. Inovio's immunotherapies function exclusively in vivo, and have generated an antigen-specific immune response against targeted diseases in all clinical trials to date.

Inovio is advancing its MERS vaccine candidate into Phase 2, in the Middle East where most MERS viral outbreaks have occurred, with the support of its collaborators: The Wistar Institute, Laval University, the NIH's Rocky Mountain Laboratories, U.S. Army Medical Research Institute of Infectious Diseases (USAMRIID), VGXI/GeneOne Life Science and the International Vaccine Institute.

University of Queensland | The molecular clamp platform

CEPI entered a [partnering agreement](#) in January 2019, with University of Queensland, for up to US\$ 10.6 million to develop a "molecular clamp" vaccine platform, a transformative technology that enables targeted and rapid vaccine production against multiple viral pathogens.

The technology works by synthesising viral surface proteins, which attach to host cells during infection, and "clamping" them into shape, making it easier for the immune system to recognise them as the correct antigen. This process requires the sequence of the viral protein which can then be determined from the viral genome. The synthetic antigen can then be purified and rapidly manufactured into a vaccine.

As part of their partnering agreement with CEPI, the University of Queensland will use their molecular-clamp vaccine platform to produce vaccines against known pathogens, including Middle East Respiratory Syndrome coronavirus (MERS-CoV) and will evaluate the safety and immune response of the Influenza and MERS-CoV candidates in a phase 1 clinical trial in humans.

Moderna | mRNA vaccine platform

Under the terms of the agreement with CEPI, Moderna will manufacture an mRNA vaccine against coronavirus, which will be funded by CEPI. Investigational New Drug-enabling studies will be conducted by the Vaccine Research Center (VRC) and a Phase 1 clinical study will be conducted in the U.S. by the Division of Microbiology and Infectious Diseases (DMID). Both VRC and DMID are divisions of the National Institute of Allergy and Infectious Diseases (NIAID), which is an institute of the NIH.

About the novel coronavirus

[Coronaviruses](#) are a family of viruses that can lead to respiratory illness, [including Middle East Respiratory Syndrome \(MERS-CoV\) and Severe Acute Respiratory Syndrome \(SARS-CoV\)](#). Coronaviruses are transmitted between animals and people and can evolve into strains not previously identified in humans. On January 7, 2020, a novel coronavirus (2019-nCoV) was identified as the cause of pneumonia cases in Wuhan City, Hubei Province of China, and additional cases have been found in a growing number of countries.

About vaccine platform technology

The term "vaccine platform technology" broadly refers to a system that uses the same basic components as a backbone, but can be adapted for use against different pathogens by inserting new sequences.

About "molecular clamp" vaccines

Enveloped viruses, like influenza, have proteins on their surface that fuse to host cells during an infection. Although these surface proteins are antigenic—and therefore elicit an immune response—they are inherently unstable. One approach to vaccine design is to synthesise these proteins on their own such that they elicit an immune response, specifically antibodies, that can kill the virus. Unfortunately, they tend to change shape when expressed on their own, a shape that does not reflect the form of the protein on the virus surface. Consequently, the immune response that is induced with these vaccines does not produce antibodies that efficiently lock on to the virus. The University of Queensland has developed a process that can synthesise these surface proteins while “clamping” them into shape, making it easier for the immune system to induce a response that recognises them on the virus surface.

This synthetic antigen can then be purified and rapidly manufactured into a vaccine, within 16 weeks from pathogen identification.

This vaccine platform technology can be used to develop vaccines against a wide range of enveloped viruses (eg, Influenza, Ebola, MERS, Lassa virus, Measles, Herpes Simplex virus, Rabies).

The Molecular Clamp is patented technology developed by Professor Paul Young, Dr Keith Chappell, and Dr Dan Watterson.

The University of Queensland will be developing this vaccine platform in collaboration with The Commonwealth Scientific and Industrial Research Organisation (CSIRO) and a wider consortium including public sector and private sector partners in Australia, USA, and Asia.

About CEPI

CEPI is an innovative partnership between public, private, philanthropic, and civil organisations, launched at Davos in 2017, to develop vaccines to stop future epidemics. CEPI has reached over US\$750 million of its \$1 billion funding target. CEPI’s priority diseases include Ebola virus, Lassa virus, Middle East Respiratory Syndrome coronavirus, Nipah virus, Rift Valley Fever and Chikungunya virus. CEPI also invests in platform technologies that can be used for rapid vaccine and immunoprophylactic development against unknown pathogens (ie, Disease X). To date, CEPI has committed to investing over \$456 million in vaccine and platform development. Learn more at www.cepi.net. Follow us at [@CEPIvaccines](https://twitter.com/CEPIvaccines).

About Inovio Pharmaceuticals, Inc.

Inovio is taking immunotherapy to the next level in the fight against cancer and infectious diseases. We are the only immunotherapy company that has reported generating CD8+ T cells in vivo in high quantity that are fully functional and whose killing capacity correlates with relevant clinical outcomes with a favorable safety profile. With an expanding portfolio of immune therapies, the company is advancing a growing clinical stage product pipeline, including candidates in Phase 3 and Phase 2. Partners and collaborators include MedImmune, Regeneron, Genentech, The Wistar Institute, University of Pennsylvania, the Parker Institute for Cancer Immunotherapy, DARPA, GeneOne Life Science, Plumblin Life Sciences, ApolloBio Corporation, Drexel University, NIH, HIV Vaccines Trial Network, National Cancer Institute, U.S. Military HIV Research Program, and Laval University. For more information, visit www.inovio.com.

About University of Queensland UQ rates in the global top 50 as measured by the Performance Ranking of Scientific Papers for World Universities and was recently rated 7th in Biotechnology world in the Shanghai Global Rankings of 2017. Professor Paul Young, Dr Keith Chappell, and Dr Dan Watterson have extensive expertise in molecular virology, viral pathogenesis and vaccine research.

About Moderna

Moderna is advancing messenger RNA (mRNA) science to create a new class of transformative medicines for patients. mRNA medicines are designed to direct the body’s cells to produce intracellular, membrane or secreted proteins that have a therapeutic or preventive benefit with the potential to address a broad spectrum of diseases. Moderna’s platform builds on continuous advances in basic and

applied mRNA science, delivery technology and manufacturing, providing the Company the capability to pursue in parallel a robust pipeline of new development candidates. Moderna is developing therapeutics and vaccines for infectious diseases, immuno-oncology, rare diseases and cardiovascular diseases, and autoimmune and inflammatory diseases, independently and with strategic collaborators. Headquartered in Cambridge, Mass., Moderna currently has strategic alliances for development programs with AstraZeneca, Plc. (NASDAQ: AZN) and Merck, Inc. (NASDAQ: MRK), as well as the Defense Advanced Research Projects Agency (NASDAQ: DARPA), an agency of the U.S. Department of Defense and the Biomedical Advanced Research and Development Authority (BARDA), a division of the Office of the Assistant Secretary for Preparedness and Response (ASPR) within the U.S. Department of Health and Human Services (HHS). Moderna has been named a top biopharmaceutical employer by Science for the past five years. To learn more, visit www.modernatx.com.

Hi Dr. Graham,

Thank you for sending the paper, it is very helpful both personally and professionally.

In regard to the trial, though I have not had much of a chance to speak with you directly, I know a lot of people are appreciative of the work that you do, and I just wanted to let you know that. [REDACTED] (b) (6)
[REDACTED] (b) (6) and she is especially appreciative knowing that the first trials are taking place in our area. It is comforting for her to know this in the midst of being asked to work unexpectedly for much longer and unpredictable shifts, as those [REDACTED] (b) (6) are now being asked to not report to work. [REDACTED] (b) (6)
[REDACTED] (b) (6). While I never really expected the professional worlds to collide (VRC [REDACTED] (b) (6)) it has lifted the spirits of many at her work knowing that something is taking place, even though this is only the start of the trial. Finally, thank you for sending the paper on the MERS-CoV, we were just talking about how durable COVID-19 and coronaviruses are in general. She has not received much guidance on protection, and the shortage of PPE is alarming.

Please take care and stay healthy!

Warmest regards,
Ken Abe

Cc: Minnich, Beth A (b) (6)>; Corey MD, Larry (b) (6)>
Subject: Lab assays for COVID-19 study

Dear Colleagues,

The HVTN/HPTN have placed into the field a natural history protocol to evaluate the immune responses post COVID-19 infection.

A draft of the study is enclosed. In short, it's a retrospective study of persons recovered from COVID-19, with 2 subsequent follow ups about 4 weeks apart. A sister prospective study of infected persons is being drafted now and will also be started. This is, in essence, a vaccine preparedness study; looking to develop how do we differentiate vaccination from infection, as well as whether we can define any immune responses that differ by population groups.

This group is to talk about just what assays we should do and prioritize, and who are the best labs to involve in this endeavor. I suspect this discussion should be 90 minutes. I have asked Julie, Georgia and David to throw out a few main ideas to provide some structure to the discussion.

Thanks –

Larry

Hi Sandra.

Nice to hear from you. Yes, things are a little more chaotic than usual around here. We've gotten off to a quick start on the new CoV outbreak.

(b) (4)

I come to Scripps periodically. I'll keep this in mind for next time.

Let me know if you want to schedule a call one evening while I'm driving home.

Best wishes,

Barney

Hi All,

Hope all is well. I'm sure that each of you are also quite overloaded with COVID related agreements, but I wanted to reach out to see if you are the appropriate contact for the attached Research Collaboration Agreement. On Sunday, Bart sent me the attached agreement for review but did not provide the original email under which the document was provided. Since we all were involved in discussions regarding setting up a RCA between Duke and the NIAID, I thought reaching out to you would be a good start so as to move this process forward. If you would like to set up a time to discuss, please let me know. Email is fine as well.

Best regards,

David

Subject: Dr. Graham / Scott H. Kennedy Call IMMUNITY

Hi Barney,

First and foremost, thank you and your team for your tireless work, you've generated one of our most valuable resources - hope. I also wanted to congratulate you on the headway you and Moderna have made on launching your Covid 19 RNA vaccine trial.

I've been working on a documentary entitled [IMMUNITY](#) about the disconcerting rise of Vaccine Hesitancy and the detrimental ramifications of misinformation for over a year now with Dr. Peter Hotez and Dr. Paul Offit, both of whom speak extremely highly of you. We've also shot with Dr. Fauci and Dr. Nancy Messonnier, who were gracious with their time and expertise.

In light of the current pandemic, our project is more pertinent than ever and it's tantamount that we create media that provides respect for scientific truth, highlights the healing and humanitarian spirit that propels so much of medical advancement and dispels myths that fracture efforts to act communally and responsibly on behalf of the greater global good.

We'd love to set up a quick call to discuss resources, potential involvement and how we can support you now and beyond this pivotal moment in Vaccine History. I've included

a one page with project information below, and also cc'd our Director of Development, Ché Landon, who will be happy to coordinate.

Looking forward to connecting soon about [IMMUNITY](#) and thank you again for your unfathomable dedication.

Best,

Scott

--

Black Valley Films is the production company behind the Academy Award Nominated film, *The Garden*, Hulu's *Food Evolution*, Showtime's *Fame High*, Spirit Award Nominee *OT: our town*, and now *Immunity*.

Support for the importance of IMMUNITY

"Now more than ever we need to convince the public that there is so much at stake regarding the importance of vaccines, the dangers of outbreaks, and how to determine the truth. Documentaries are a wonderful way to do that, and Scott has proven with FOOD EVOLUTION that he is devoted to getting the science right!"

Dr. Paul Offit

PROFESSOR OF PEDIATRICS, DIVISION OF
INFECTIOUS DISEASES, THE CHILDREN'S
HOSPITAL OF PHILADELPHIA

"Scott's brilliant documentary FOOD EVOLUTION confirmed his special talent for communicating sound science in a compelling fashion. In Immunity he will vanquish misconceptions about vaccination with equal dispatch. The need is great. In locales across the country, vaccination refusal and hesitance have led to measles outbreaks. This timely project will save lives."

Kathleen Hall Jamieson, Ph.D.

DIRECTOR, ANNENBERG PUBLIC POLICY CENTER

Immunity's audience just went GLOBAL.

Before Covid-19, the Academy Award Nominated team at Black Valley Films saw the importance and necessity of telling the story of record-breaking global outbreaks, and how much Vaccine Hesitancy and Anti-Vaxxers have influenced not only those rising outbreaks, but how they've corroded many aspects of a long-trusted social contract to protect our communities. And with that, [IMMUNITY](#), was born.

With the emergence of Covid 19 we find ourselves at an unrivaled advantage as filmmakers--having *already* cultivated relationships with top public health experts including the Head of the NIAID, [Dr. Tony Fauci](#), vaccine experts [Dr. Peter Hotez](#) and [Dr. Paul Offit](#), as well as [Dr. Nancy Messonnier](#) and her colleagues at the CDC.

[Black Valley Films](#) has been invited to a coveted seat at the table to capture history as it rapidly unfolds on the frontlines.

We need to ramp up production to track the answers to [IMMUNITY'S](#) most pressing questions: What will win: **Science or disease? Truth or misinformation? The best of human nature or the worst of it?**

[IMMUNITY](#) will highlight avenues of hope, dismantle obstacles to truth, and celebrate all those at the forefront of this pandemic as they courageously blaze the trail to collective recovery.

Black Valley Films needs to hit our \$3 million goal to bring this essential piece of investigative journalism to full fruition. We have two key ways to support: A tax deductible contribution through our 501-(c)(3) sponsor, or as an Investor (including return on investment with interest, and pari passu backed participation with other investors).

Make a Tax Deductible CONTRIBUTION

Hi Jon,

We are close to the same age, and agree that it feels like there is still quite a bit of life left, God willing.

Good to hear your work is progressing. I've added Dr. Kizzmekia Corbett to the email because she is the scientific lead for our coronavirus work.

We do have

(b) (4)

(b) (4)

Best wishes,
Barney

Dear Dr. Graham:

We have met over the years in some of the HIV meetings and hope that you might be able to help me.

We have been studying the antibody - virus interaction in various human viral infections with the specific goal of characterizing the cognate epitopes of neutralizing antibodies. For this we have developed various combinatorial phage display technologies and a panel of computational

algorithms that allow us to predict conformational discontinuous epitopes and most recently analyze disease defining polyclonal sera from infected people.

Recently we have received an Israel Academy grant focused on (b) (4) which as you obviously can appreciate is a serious concern for Israel and the Middle East in general.

I was hoping that we might be able to obtain some of the (b) (4)

Obviously, I will be sure to process any MTA that would be required. Also if you can provide a (b) (4) that would be great.

Thanks very much for your consideration,

Best regards,

Jon

This is a very quick review. I think the list could be easily narrowed down to a top ten.

I highlighted some things I think could work (yellow) and some things that I don't think will work (gray) and some things that should not be done (red/pink). Most have comments to explain thinking.

Subject: SARS-CoV-2 Vaccine Working Group

When: Thursday, April 16, 2020 2:00 PM-3:00 PM (UTC-05:00) Eastern Time (US & Canada).

Where: WebEx for the foreseeable future

Dear all,

You are invited to share progress and discuss issues relevant to the development of vaccines against COVID 19 on a weekly basis with your PHEMCE colleagues.

An agenda, presentation materials and supporting documents will be provided in advance of the meetings.

Many thanks in advance for your participation,

Armen, Cristina and Erik

You said it much more eloquently than me.

My email attached just to Courtney.
