APPENDIX 2.6: Cumulative and Interval Summary Tabulation of Serious and Non-Serious Adverse Reactions From Post-Marketing Sources Organized per MedDRA System Organ Class by High Level Term

Cumulative Reporting Period: Through 31-MAY-2021

Interval Reporting Period: 30-APR-2021 Through 31-MAY-2021

Total Number of Cases: 47,174 (Interval) / 167,956 (Cumulative)

Total Number of Adverse Events (PT): 174,177 (Interval) / 631,356 (Cumulative)

MedDRA Version: v.24.0J

Appendix 3 (Referred to in Section 9.2 Overview of Signals)

Tabular Summary of Safety Topics and Signals Evaluated During the Reporting Period

Product name: PF-07302048 (BNT162b2)

Reporting interval: 30 April 2021 – 31 May 2021

Please note the following items that were included in SMSR # 5 (01 April – 29 April 2021) and are therefore not included in the table below:

- On 05 May 2021, Trigeminal Neuralgia was reviewed and determined not to be a validated signal.
- On 06 May 2021, Nephrotic syndrome was reviewed and determined not to be a validated signal.
- On 06 May 2021, the safety signal Seizure was reviewed and determined not to be a risk.

Table 1. Tabular Summary of Safety Topics and Signals Considered During the Reporting Period

Safety Topic or Signal	Date opened	Status	Date closed	Source	Reason	Data reviewed	Result or Action(s)
Signals Determined to be Risks							
None							
Signals Determined not to be Risks							
Appendicitis	18 Sep 20 Re-opened 06 May 2021	Closed	13 May 2021	18 Sep 2020: Clinical Trial Data 06 May 2021: Request from a health authority (Health Canada)	To determine if appendicitis is a risk	Clinical study, post-authorization safety data and O/E analyses	The available data do not support a causal association with the vaccine. The topic will continue to be monitored with routine surveillance.
Dizziness	Reopened 10 May 2021	Closed	09 Jun 2021	Request from a health authority (UK MHRA)	To determine if dizziness is a risk	Clinical study, post-authorization safety data	The available data do not support a causal association with the vaccine at this time.
Safety Topics Determined not to be Validated Signals							

Table 1. Tabular Summary of Safety Topics and Signals Considered During the Reporting Period

Safety Topic or Signal	Date opened	Status	Date closed	Source	Reason	Data reviewed	Result or Action(s)
Menstrual cycle abnormalities	10 May 2021	Closed	19 May 2021	Request from a health authority (Israel MOH)	Request from Israeli Ministry of Health for information that has accumulated about changes in the menstrual cycle associated with vaccination	Clinical study and post-authorization safety data	The available data do not support this topic as a validated signal
Acute Pancreatitis	21 May 2021	Closed	04 Jun 2021	Information in health authority PV report	France ANSM 14 th PV report on AEs reported with the Pfizer-BioNTech Comirnaty vaccine considered this a potential signal	Post-authorization safety database data	The available data do not support this topic as a validated signal
Acute disseminated encephalomyelitis (ADEM)	09 May 2021	Closed	26 May 2021	Epidemiology signal detection and health authority request (PRAC in SMSR #5)	Observed versus expected analysis performed for the April (5 th) 2021 SMSR had an upper level of the 95% CI exceed 1 for at least one of the risk windows in at least one of the risk periods. A request was received in the SMSR #5 Assessment Report to provide an evaluation of reports of ADEM	Post-authorization safety data and review of O/E Analysis (please refer to Appendix 5.1 for details)	The available data do not support this topic as a validated signal
Transverse myelitis	09 May 2021 Re-opened 01 Jun 2021	Closed	26 May 2021 and 07 Jun 2021	Epidemiology signal detection and health authority request (TGA in SMSR #5)	Observed versus expected analysis performed for the April (5 th) 2021 SMSR had an upper level of the 95% CI exceed 1 for at least one of the risk windows in at least one of the risk periods	Post-authorization safety data and review of O/E Analysis (please refer to Appendix 5.1 for details)	The available data do not support this topic as a validated signal

Table 1. Tabular Summary of Safety Topics and Signals Considered During the Reporting Period

Safety Topic or Signal	Date opened	Status	Date closed	Source	Reason	Data reviewed	Result or Action(s)
Guillain-Barre syndrome	26 Feb 2021 Re-opened 21 May 2021	Closed	26 May 2021	Information in health authority PV report and Epidemiology signal detection	France ANSM 14 th PV report on AEs reported with the Pfizer-BioNTech Comirnaty vaccine considered this a potential signal and Observed versus expected analysis performed for the April (5 th) 2021 SMSR had an upper level of the 95% CI exceed 1 for at least one of the risk windows in at least one of the risk periods	Post-authorization safety data and review of O/E Analysis (please refer to Appendix 5.1 for details)	The available data do not support this topic as a validated signal
Abnormal Behavior/ Mental Disorder	13 May 2021	Closed	28 May 2021	Request from a health authority (Japan PMDA)	Request from PMDA to provide literature review and opinion of case review.	Post-authorization safety data and literature review	The available data do not support this topic as a validated signal
Acquired Hemophilia	25 May 2021	Closed	04 Jun 2021	Information in health authority PV report	France ANSM 15 th PV report on AEs reported with the Pfizer-BioNTech Comirnaty vaccine considered this a potential signal	Post-authorization safety database review	The available data do not support this topic as a validated signal
Ongoing Safety Topics/Signals							
Myocarditis and Pericarditis	15 Feb 2021 Re-opened 19 April 2021 Re-opened 24 May 2021	Ongoing	N/A	Ongoing discussions with a health authority (Israel MoH) Request from health authorities	To determine if myocarditis or pericarditis is a risk	Clinical study and post-authorization safety data. Literature and O/E analyses	Data available to Pfizer/BNT does not support a causal association with vaccine, however this signal will remain open while other evaluations are ongoing

Appendix 3.1 (Referred to in Section 9.2 Overview of Signals)

Summary of Safety Topic and Signal Evaluations

Table 1 presents summaries of safety topics and signals for PF-07302048 (BNT162b2) during the current reporting period.

Please note the following items that were included in SMSR # 5 (01 April – 29 April 2021) and are therefore not included in the table below:

- On 05 May 2021, Trigeminal Neuralgia was reviewed and determined not to be a validated signal.
- On 06 May 2021, Nephrotic syndrome was reviewed and determined not to be a validated signal.
- On 06 May 2021, the safety signal Seizure was reviewed and determined not to be a risk.

Table 1. Summary of Safety Topics & Signals Considered During the Reporting Period

Signal/Topic	Summary of Evaluation
Signals determined to be risks	
None	
Signals determined not to be risks	
Appendicitis	A request was received from Health Canada for a cumulative assessment of reports of appendicitis following vaccination with Pfizer/BNT COVID-19 Vaccine and referenced data from the Uppsala Monitoring Center dated April 2021. The data was not provided and was not able to be found by Pfizer. Clinical study data, post-authorization AE reports and O/E analyses were reviewed and the available information did not support a causal association with the vaccine at this time (see Appendix 3.2). This topic will continue to be monitored with routine surveillance.
Dizziness	A request was received from UK (MHRA) to review dizziness and determine if it should be considered an ADR. An evaluation of dizziness reports in the post-authorization setting and clinical study (C4591001) was performed (see Appendix 3.7). Post-authorization reports of dizziness were highest within 24 hours following vaccination and decreased with time from vaccination. There were relatively few cases of dizziness where an inability to drive was reported. The available information supports dizziness associated with the vaccination process (i.e. stress-related response) but not a causal association with the vaccine itself at this time.
Safety topics determined not to be validated signals	
Menstrual cycle abnormalities	A request was received from the Israel Ministry of Health to review information about changes in menstrual cycles reported in association with the vaccine. A review of menstrual terms from the clinical study data and from the post-authorization AE reports was undertaken. The available data did not support a validated signal at this time. This topic will continue to be monitored with routine surveillance.
Acute Pancreatitis	The ANSM 14 th PV report of AEs reported co-incident with Pfizer/BNT COVID-19 vaccinations, noted 15 serious cases of acute pancreatitis as of 29 April 2021 as a potential signal. A review of post-authorization safety reports of acute pancreatitis was undertaken and this topic was determined not to be a validated signal.

Table 1. Summary of Safety Topics & Signals Considered During the Reporting Period

Signal/Topic	Summary of Evaluation
Acute disseminated encephalomyelitis (ADEM)	The epidemiology signal detection O/E analyses had an upper level of the 95% CI that exceeded 1 for at least one of the risk windows in at least one of the risk periods in the previous SMSR. Post-authorization safety data was reviewed as was the numerator and denominator used for the O/E analyses. A smaller denominator was used while the numerator was unchanged (see Appendix 5.1 for details). In the PRAC Assessment Report for SMSR #5, a request was made for an evaluation of ADEM to be provided in the SMSR #6. The post-authorization data review (see Appendix 3.3) and examination of O/E analyses was done and this topic was determined not to be a validated signal.
Transverse myelitis	A request was received from Australia TGA to provide a cumulative overview of TM cases in the next SMSR. In addition, the epidemiology signal detection O/E analyses had an upper level of the 95% CI that exceeded 1 for at least one of the risk windows in at least one of the risk periods in the previous SMSR. Post-authorization safety data was reviewed (see Appendix 3.6) as was the numerator and denominator used for the O/E analyses. A smaller denominator was used while the numerator was unchanged (see Appendix 5.1 for details). This topic was determined not to be a validated signal.
Guillain-Barre syndrome	The ANSM 14th PV report of AEs reported co-incident with Pfizer/BNT COVID-19 vaccinations, noted 2 new cases of Guillain Barré syndrome over the period, bringing the total to 7 cases since the start of vaccination and considered it to be a potential signal. A review of post-authorization safety reports of GBS cases was undertaken (see Appendix 3.8) and this topic was determined not to be a validated signal.
Abnormal behavior/Mental disorder	A request was received from Japan PMDA to provide a summary of literature and evaluation of the safety reports on abnormal behavior or mental disorders reported co-incident with vaccination. Following review of all information, this topic was determined not to be a validated signal.
Acquired Hemophilia	The ANSM 15 th PV report of AEs reported co-incident with Pfizer/BNT COVID-19 vaccinations, noted 3 cases of acquired hemophilia since the start of vaccination and considered is a potential signal. A review of the small number of post-authorization AE reports of acquired hemophilia was undertaken and this topic was determined not to be a validated signal
Ongoing evaluations of safety topics or signals	
Myocarditis and Pericarditis	Due to ongoing discussions with the Israel MoH regarding cases of myocarditis reported in Israel, a re-evaluation of accrued cases of myocarditis and pericarditis was undertaken. The review of clinical study data and post-authorization reports utilized the newly published draft Brighton Collaboration case definition of myocarditis (see Appendix 3.9). The available data did not support a causal association with the vaccine; however, this signal will remain open as additional investigations are ongoing.

APPENDIX 3.2 SAFETY EVALUATION OF APPENDICITIS

1. INTRODUCTION

Appendicitis is an inflammation of the vestigial vermiform appendix that may present with right lower quadrant abdominal pain, anorexia, nausea, vomiting, and low-grade fever.ⁱ Appendicitis is a known worldwide disease. The incidence of appendicitis is approximately 100 per 100,000 patients in North America and it ranged from 105 in Eastern Europe to 151 per 100,000 patients in Western Europe. The incidence of appendicitis is higher in newly industrialized countries in Asia (South Korea: 206), the Middle East (Turkey: 160), and Southern America (Chile: 202).ⁱⁱ Although appendicitis can strike at any age, it is rare in children younger than 2.ⁱⁱⁱ Appendicitis is more common in males as compared to females (male-to-female ratio of 1.4:1). The incidence is highest in the 10-to-19-year-old age group, and in adults it occurs most frequently in the second and third decades of life.^{iv} Appendicitis may have more than one underlying etiology.^v The primary cause of appendicitis is appendiceal obstruction and it can be caused by fecalith, calculi, benign or malignant tumors, foreign body, lymphoid hyperplasia, abdominal trauma, infections and or parasites.^{vi} Appendicitis is the most common abdominal surgical emergency, and most patients will require immediate appendectomy (laparoscopic or open).^{vii} Appendicitis is not a common feature of SARS-CoV-2 virus, but it has been reported in four case reports that suggested a possible association.^{viii}

No articles in the literature have been found that causally establish a link of vaccination to appendicitis. A single article by Gee et al 2011 on monitoring the safety of quadrivalent human papillomavirus vaccine mentioned that although the biologic plausibility of appendicitis following HPV4 is not substantiated, appendicitis was identified as one of the frequently reported serious adverse events following HPV4 during prelicensure trials when compared to the placebo group (0.03% HPV4 (5 cases) vs. 0.01% placebo (1 case)). This statistical signal indicating a potential increased risk of appendicitis following HPV4 vaccination among youth was shown after further investigation that it was not a true association, but rather the result was due to a modification of the electronic medical record system.^{ix}

2. METHODOLOGY

Pfizer's safety database contains cases of adverse events reported spontaneously to Pfizer, cases reported by the health authorities, cases published in the medical literature, cases from Pfizer-sponsored marketing programs, non-interventional studies, and cases of serious adverse events that have been unblinded reported from clinical studies regardless of causality.

The Pfizer safety database was searched for all BNT162b2 vaccine spontaneous and literature reports and serious clinical trial reports received through 7 May 2021 using the following MedDRA version 24.0 search criteria: PTs: Appendicitis, Appendicitis perforated; Complicated appendicitis.

The limitations of post-marketing adverse drug event reporting should be considered when interpreting these data:

- Reports are submitted voluntarily, and the magnitude of underreporting is unknown. Some of the factors that may influence whether an event is reported include: length of time since marketing, market share of the drug, publicity about a drug or an adverse event, seriousness of the reaction, regulatory actions, awareness by health professionals and consumers of adverse drug event reporting, and litigation.
- Because many external factors influence whether or not an adverse event is reported, the spontaneous reporting system yields reporting proportions not incidence rates. As a result, it is generally not appropriate to make between-drug comparisons using these proportions; the spontaneous reporting system should be used for signal detection rather than hypothesis testing.
- In some reports, clinical information (such as medical history, validation of diagnosis, time from drug use to onset of illness, dose, and use of concomitant drugs) is missing or incomplete, and follow-up information may not be available.
- An accumulation of adverse event reports does not necessarily indicate that a particular adverse event was caused by the drug; rather, the event may be due to an underlying disease or some other factor(s) such as past medical history or concomitant medication.

3. RESULTS

Post-Authorisation Data

A total of 96 cases have been retrieved using the criteria mentioned above. There were 65 females, 28 males, and for 3 cases gender was not reported. Age was reported as ranging from 22 to 85 years (mean: 48.4; N: 89). A total of 70 cases were reported in adults (≥ 18 -<65), 19 cases were reported by elderly (≥ 65), and for 7 cases age was not reported. All cases were reported as serious.

Most cases were reported by US (63.5%), UK (9.4%) and France (6.3%). Medical history was provided in 49 cases. Relevant medical history was provided in 19 cases: 4 cases reported appendicitis in the medical history, 6 cases reported Covid-19 infection, 5 cases reported diabetes, 2 reported Mixed connective tissue disease / Sjogren's syndrome and Cutaneous lupus erythematosus / Sjogren's syndrome, 2 cases reported cancer, 1 case reported Diverticulitis, 1 case reported Hodgkin's disease / Sarcoidosis, 1 case reported diarrhea/gastrointestinal disorder, 2 cases reported general disease/familiar risk factors, and 1 case reported abdominal pain.

Latency from vaccination to appendicitis was provided in 88 reports and ranged from day 0 to day 225:

- Same day of vaccination (6)
- 1-7 day following vaccination (58)
- 8-14 days following vaccination (12)
- >14-28 days following vaccination (8)
- >28 days following vaccination (4)

Outcome was reported as recovered/recovering/recovered with sequel in 77 cases, not recovered at time of reporting in 10 cases, and unknown in 9 cases.

Clinical trial data

Cases of appendicitis (including PTs Appendicitis perforated and Complicated appendicitis) were also searched for in the placebo-controlled period of Study C4591001.

In the Phase 2/3 safety population of Study C4591001 in participants ≥ 16 years of age, from the time of dose 1 to the unblinding date, the number of cases was similar in the two arms. There were 14 cases of appendicitis and 1 case of perforated appendicitis in the BNT162b2 group (15 cases total, N=21,926), and 9 cases of appendicitis, 2 cases of complicated appendicitis, and 1 case of perforated appendicitis in the placebo group (12 cases total, N=21,921). The data-lock date was 13 March 2021.

4. EPIDEMIOLOGY ANALYSIS

The MAH conducted unadjusted observed to expected ratio (O/E) analyses for the 96 reported appendicitis cases. The O/E ratio was below 1 for both the 21-day risk window and no risk window, indicating there was not an increased risk of appendicitis among recipients of the BNT162b2 vaccine.

Table 5. Observed versus Expected (O/E) Analysis of 96 Spontaneously Reported Appendicitis Cases through 07 May 2021

	21-Day Risk Window (11,312,184 PY ^a)	No Risk Window (30,415,757 PY)
O/E ratio (95% CI)	0.009 (0.007, 0.011)	0.003 (0.003, 0.004)
Expected cases ^b	10,916.26	29,351.21

a. PY through 30 April 2021

b. Derived from 96.5 per 100,000 PY background rate

Observed case counts were identified using the PT codes appendicitis, perforated appendicitis, and appendicitis complicated. Expected case counts were derived using a background incidence rate of 96.5 per 100,000 person years.^X Person years of exposure estimates were derived from publicly available information reported by countries where the BNT162b2 vaccine is authorized.^{XI} For periods when more than one vaccine brand was

authorized for use in each country, the doses administered were assumed to be divided equally by the number of brands of vaccines authorized. The estimate of administered doses does not reflect exposure in persons vaccinated in countries that did not publicly report.

O/E ratios were calculated using a 21-day risk window and no risk window. However, the 21-day risk window was not applied to the observed case count; all 96 cases were included in the numerator regardless of the duration between vaccination and event onset date.

Several limitations of the observed to expected comparison must be noted. With respect to observed cases, case ascertainment through the spontaneous reports likely reflect an underreporting due to incomplete reporting or a lag in reporting. Additionally, spontaneous surveillance systems are prone to reporting bias whereby events that have been previously identified as potentially related to the vaccine are more likely to be reported despite not meeting the clinical definition. Conversely, events that have not been previously associated with a vaccine are likely to be underreported.

With respect to the expected case counts, estimates concerning both exposure to vaccine and the background rate have limitations. Our exposure estimate assumes that the number of reported administrations is complete and accurate when in fact not all countries administering vaccine have reported counts of vaccine administration to the data source. Thus, the exposure is underestimated.

The expected count also assumes that the expected incidence rate in the vaccinated population is the same as that in the population used to calculate the background rate. However, it is possible that the delivery of health care, population demographics, and underlying health status of the population used for the background rate estimate differ from those expected in the vaccinated population. To date, the majority of exposure derives from the US.

A final limitation concerns the risk window, the period during which one is expected to be at risk of a given event if there is a causal association between the event and the vaccine. Two periods, 21 days and no risk window, were selected to provide an estimate assuming a more acute onset (21-day window) and a more latent onset (no risk window). The 21-day risk window is particularly conservative as all observed cases are included in the numerator of the O/E ratio regardless of the days since vaccination dose, which will lead to an overestimation of the ratio if observed cases occurred outside of the risk window.

5. CONCLUSION

Appendicitis has been spontaneously reported following vaccination with Pfizer/BNT B162b2 vaccine in the post-authorization setting. However, the totality of the reviewed information does not support a causal association between the vaccine and appendicitis. There is not a clear mechanism to explain why vaccinated individuals may have an increased risk for appendicitis and there is a distinct lack of literature establishing a causal association of any vaccination to the occurrence of appendicitis. There are a relatively low number of reports of appendicitis in the context of the hundreds of millions of doses of vaccine administered in the post-authorization setting, statistical signal detection activities have not

090177e19749cf15Approved\Approved On: 14-Jun-2021 14:01 (GMT)

identified a disproportionate occurrence of reports of appendicitis, and the observed to expected analyses have not identified a higher than expected number of cases of appendicitis.

Additionally, the placebo-controlled clinical trial data did not show a concerning imbalance in number of cases of appendicitis in BNT162b2 recipients compared to placebo-recipients.

This topic will continue to be followed by the MAH. The benefit risk of the vaccine remains favorable.

1. INTRODUCTION

The topic of encephalomyelitis was reviewed because an observed versus expected analysis performed for the April 2021 Summary Monthly Safety Report had an observed to expected ratio greater than 1 for the cumulative 21-day risk window and for the interval evaluations. The review is to include data from spontaneous reports as well as an observed/expected analysis.

1.1 ACUTE DISSEMINATED ENCEPHALOMYELITIS (ADEM)

Acute disseminated encephalomyelitis (ADEM) is considered a monophasic demyelinating disease of the central nervous system (CNS). ADEM presents most commonly with multifocal neurological deficits along with encephalopathy. Symptoms most commonly include: altered consciousness (lethargy, stupor, coma) and/or altered behavior (irritability or confusion), weakness of the lower and/or upper extremities, ataxia, cranial nerve palsies, seizures, fever, headache and/or vomiting, and meningeal signs. The most common MRI finding is the presence of multiple bilateral T2-enhancing supratentorial white matter lesions. Analysis of the CSF is initially necessary to exclude acute CNS infection, because of the acute therapeutic implications of identifying an infection. CSF usually shows inflammation with pleocytosis and/or elevated protein; however, CSF findings are reported at variable time points within the clinical course of ADEM.¹⁻³

Young and adolescent children are most commonly affected. The estimated incidence in the general population is 0.8 per 100,000 population per year,³ nevertheless, the estimated incidence of ADEM varies according to age. The current reported incidence of ADEM is 0.4/ 100 000/ year (< 20 years of age) or 0.64/ 100,000/ year (< 15 years), and is even greater when considering data for younger ages (0.8/ 100,000/ year [5– 9 years]).² In about 50% to 75% of all cases, the clinical onset of disease is preceded by viral or bacterial infections, mostly non-specific upper respiratory tract infections.³

1.2 ENCEPHALOMYELITIS AND VACCINATION

Acute disseminated encephalomyelitis following a vaccination has also been described. It has been previously reported that approximately 5% of cases of ADEM are preceded by vaccination within 1 month prior to symptom onset, however no causal link has been established between ADEM and vaccination.

Vaccination-associated ADEM has been most frequently observed after measles, mumps and rubella vaccinations.⁴ The incidence of a measles vaccination-associated ADEM is about 10 to 20 per 100 000 vaccinated individuals and thus considerably lower than the incidence of ADEM after a wild-type measles encephalitis (100 per 100 000 infected individuals).³

Typically, there is a latency of 7 to 14 days between a febrile illness and the onset of neurological symptoms. In the case of vaccination-associated ADEM, this latency period has been described to be longer. The Collaborating Center for Reference and Research on Viral Hepatitis of the World Health Organization (Geneva, Switzerland), for instance, has deemed a maximal period of 3 months to diagnose a vaccination-associated ADEM.³ Numerous report of ADEM have been described both after H1N1 infection and H1N1 vaccination.⁵⁻⁷

1.2 ENCEPHALOMYELITIS AND COVID-19

Although the respiratory system complications of Coronavirus Disease 2019 (COVID-19) have been the most frequent and life threatening, there are increasing reports of central and peripheral nervous system involvement. These neurological complications have included encephalopathy, meningo-encephalitis, ischaemic stroke, acute necrotizing encephalopathy, and Guillain-Barré Syndrome. The postulated mechanisms of the various neurological syndromes include, either individually or in combination, direct viral neuronal injury, a secondary hyperinflammation syndrome⁸ para- and post-infectious inflammatory or immune-mediated disorders, or the effects of a severe systemic disorder with the neurological consequences of sepsis, hyperpyrexia, hypoxia, hypercoagulability and critical illness.⁹

A well written review by Garg et al¹⁰ describes the hypoxic/metabolic changes that are produced by intense inflammatory response against the virus which in turn triggers cytokine storm and subsequently acute respiratory distress syndrome. In some cases, in presence of comorbidities, the hypoxic/metabolic changes predispose to development of encephalopathy and multiple organ failure. The presence of anosmia and ageusia can help in differentiation from other encephalopathies. Detection of SARS-CoV-2 has been detected in some cases in the nasopharyngeal swab but in other cases was detected only in the cerebrospinal fluid.¹¹

Encephalopathy is common in older patients, the majority are more than 50 years of age and mostly in subjects that are severely or critically ill. Instead, ADEM is more common in children and adolescent. Most of the time encephalitis secondary to SARS-CoV-2 is preceded by commoner clinical features like, fever, cough, dyspnoea, and headache. In majority, patients are already in the intensive care unit, when encephalopathy develops.^{10,12} Nevertheless, few case reports describing headache and neurological symptoms before hypoxic symptoms have also been described.¹¹ Other cases reported association of diffuse leukoencephalopathy and microhemorrhages.^{13,14}

2. METHODOLOGY

Pfizer's safety database contains cases of adverse events reported spontaneously to Pfizer, cases reported by the health authorities, cases published in the medical literature, cases from Pfizer-sponsored marketing programs, non-interventional studies, and cases of serious adverse events reported from clinical studies regardless of causality.

The Pfizer safety database was searched for all BNT162b2 vaccine cases received through 18 May 2021 using the MedDRA version 24.0 search criteria: SMQ: Non-infectious encephalitis, narrow.

The limitations of post-marketing adverse drug event reporting should be considered when interpreting these data:

- Reports are submitted voluntarily, and the magnitude of underreporting is unknown. Some of the factors that may influence whether an event is reported include: length of time since marketing, market share of the drug, publicity about a drug or an adverse

event, seriousness of the reaction, regulatory actions, awareness by health professionals and consumers of adverse drug event reporting, and litigation.

- Because many external factors influence whether or not an adverse event is reported, the spontaneous reporting system yields reporting proportions not incidence rates. As a result, it is generally not appropriate to make between-drug comparisons using these proportions; the spontaneous reporting system should be used for signal detection rather than hypothesis testing.
- In some reports, clinical information (such as medical history, validation of diagnosis, time from drug use to onset of illness, dose, and use of concomitant drugs) is missing or incomplete, and follow-up information may not be available.
- An accumulation of adverse event reports does not necessarily indicate that a particular adverse event was caused by the drug; rather, the event may be due to an underlying disease or some other factor(s) such as past medical history or concomitant medication.

Brighton Collaboration Criteria

Cases were adjudicated according to Brighton Collaboration case definition and level of diagnostic certainty for encephalitis as described below.¹⁵

Level 1 of diagnostic certainty: Encephalitis

- a. Demonstration of acute inflammation of central nervous system parenchyma (\pm meninges) by histopathology.

Level 2 of diagnostic certainty: Encephalitis

- a. Encephalopathy (e.g. depressed or altered level of consciousness, lethargy, or personality change lasting >24 h),

AND INCLUDING

- b. ONE OR MORE of the following:

1. Decreased or absent response to environment, as defined by response to loud noise or painful stimuli,
2. Decreased or absent eye contact,
3. Inconsistent or absent response to external stimuli,
4. Decreased arousability,
5. Seizure associated with loss of consciousness

OR

090177e19749cf15\Approved\Approved On: 14-Jun-2021 14:01 (GMT)

- c. Focal or multifocal findings referable to the central nervous system, including one or more of the following:
1. Focal cortical signs (including but not limited to: aphasia, alexia, agraphia, cortical blindness),
 2. Cranial nerve abnormality/abnormalities,
 3. Visual field defect/defect(s),
 4. Presence of primitive reflexes (Babinski's sign, glabellar reflex, snout/sucking reflex),
 5. Motor weakness (either diffuse or focal; more often focal)
 6. Sensory abnormalities (either positive or negative; sensory level),
 7. Altered deep tendon reflexes (hypo- or hyperreflexia, reflex asymmetry),
 8. Cerebellar dysfunction, including ataxia, dysmetria, cerebellar nystagmus.

AND (for both possibilities to reach Level 2)

- d. TWO OR MORE of the following indicators of inflammation of the CNS:
1. Fever (temperature $\geq 38^{\circ}\text{C}$),
 2. CSF pleocytosis (>5 WBC/mm³ in children >2 months of age; >15 WBC/mm³ in children <2 months of age),
 3. EEG findings consistent with encephalitis, or
 4. Neuroimaging consistent with encephalitis.

Level 3 of diagnostic certainty: Encephalitis

- a. Encephalopathy (eg, depressed or altered level of consciousness, lethargy, or personality change lasting >24 h),

AND INCLUDING

- b. ONE OR MORE of the following:
1. Decreased or absent response to environment, as defined by response to loud noise or painful stimuli,
 2. Decreased or absent eye contact,
 3. Inconsistent or absent response to external stimuli,

4. Decreased arousability, or
5. Seizure associated with loss of consciousness

OR

- c. Focal or multifocal findings referable to the central nervous system, including one or more of the following:
 1. Focal cortical signs (including but not limited to: aphasia, alexia, agraphia, cortical blindness),
 2. Cranial nerve abnormality/abnormalities,
 3. Visual field defect/defect(s),
 4. Presence of primitive reflexes (Babinski's sign, glabellar reflex, snout/sucking reflex),
 5. Motor weakness (either diffuse or focal; more often focal)
 6. Sensory abnormalities (either positive or negative; sensory level),
 7. Altered deep tendon reflexes (hypo- or hyperreflexia, reflex asymmetry), or
 8. Cerebellar dysfunction, including ataxia, dysmetria, cerebellar nystagmus.

AND (for both possibilities to reach Level 3)

- d. ONE of the following indicators of inflammation of CNS:
 1. Fever (temperature $\geq 38^{\circ}\text{C}$),
 2. CSF pleocytosis ($>5\text{WBC}/\text{mm}^3$ in children >2 months of age; $>15\text{WBC}/\text{mm}^3$ in children <2 months of age),
 3. EEG findings consistent with encephalitis, or
 4. Neuroimaging consistent with encephalitis.

Level 3A of diagnostic certainty

- a. Insufficient information is available to distinguish case between acute encephalitis or ADEM; case unable to be definitively classified.

Additional category for analysis

Level 4

090177e19749cf15\Approved\Approved On: 14-Jun-2021 14:01 (GMT)

Reported encephalitis/ADEM with insufficient evidence to meet the case definition.

Level 5

Not a case of encephalitis/ADEM (investigation reveals a negative finding of a necessary criterion or if an exclusion criterion is met such as presence of a clear alternative acute infection or other diagnosis of illness).

3. RESULTS

A total of 78 cases were identified from the database using the search criteria mentioned above through 18 May 2021. Almost all cases (77) were spontaneous reports, only one was from a Pfizer-sponsored interventional study. The majority of the cases, 64 (82.1%), were medically confirmed, and the remaining 14 (17.9%) were non-medically confirmed. The reported age ranged from 18 years to 91 years (mean 54.2 N=74, median 51.5 N=74), with the case distribution by age as shown in Table 1.

Table 1. Case Distribution by Age

	Number of cases	Percentage (%)
18 - 30 years	12	15.4 %
31 - 50 years	24	30.8 %
51 - 64 years	9	11.5 %
65 - 74 years	8	10.3 %
Greater than or equal to 75 years	21	26.9 %
Unknown	4	5.1 %

Of the 78 reports, 48 (61.5%) were reported as females, 29 (37.2%) as males, and in 1 (1.3%) case sex was not reported.

Most of the cases were reported from United States (18, 23.1%), followed by United Kingdom (14, 17.9%) and France and Spain (6 each, 7.7%). The top ten reporting countries are in Table 2.

Table 2. Top 10 Reporting Countries

	Number of cases	Percentage (%)
UNITED STATES	18	23.1 %
UNITED KINGDOM	14	17.9 %
FRANCE	6	7.7 %
SPAIN	6	7.7 %
GERMANY	5	6.4 %
JAPAN	5	6.4 %
SWITZERLAND	4	5.1 %
AUSTRIA	3	3.8 %

FINLAND	2	2.6 %
ISRAEL	2	2.6 %
ITALY	2	2.6 %
MEXICO	2	2.6 %
SWEDEN	2	2.6 %

Case outcome was reported as recovered/recovering/recovered with sequelae in 33 cases (42.3%), not recovered at time of reporting in 28 cases (35.9 %), and outcome was unknown in 11 cases (14.1%) There were also 6 fatal cases (7.7%) (see separate discussion below).

Time to onset was reported in 58 cases and in 12 cases (15.4%) it was reported as the same vaccination day or the day after, in 43 cases (55.1%), time to onset ranged between 2 to 21 days post vaccination, in 3 cases (3.8%) time to onset was reported as 22, 28 and 38 days post vaccination respectively and in 20 cases (25.6%) it was not reported.

In 27 cases (34.6%), the events were reported after the first dose of the vaccination, in 14 cases (17.9%) after the second dose and in 37 cases (47.4%) it was unspecified.

Among the 27 cases reporting the event after the first dose of the vaccination, time to onset was reported as detailed in Table 3.

Table 3. Time to Onset After 1st Vaccination

Days after 1 st vaccination	Number of cases
Same vaccination day	4
1-4 days	8
5-12 days	7
13-21 days	2
>21 days	2
Unspecified	4
Total	27

Among the 14 cases reporting the event after the second dose of the vaccination, time to onset was reported as detailed in Table 4.

Table 4. Time to Onset After 2nd Vaccination

Days after 2 nd vaccination	Number of cases
Same vaccination day	2
1-4 days	6
5-12 days	3
13-21 days	2
38 days	1
Total	14

All cases were assessed according to BC criteria. Two cases were removed. One was a duplicate and the other one did not mention any relevant PT for this analysis in the case narrative. Of note, none of the cases met BC level 1. The remaining 75 cases were assessed as follows:

- 7 cases (9.2%) met level 2;
- 11 cases (14.5%) met level 3;
- 41 cases (55.3%) met level 4 (reported encephalitis/ADEM with insufficient evidence to meet the case definition);
- 16 cases (21%) met level 5 (not a case of encephalitis/ADEM).

Among the 59 cases that met BC level 2, 3 and 4, alternative explanations including previous recent infections/COVID-19 infection, previous auto-immune disease/neurologic co-morbidities, underlying disease and confounding therapy, alternative medical conditions/background medical history that may have predisposed to the occurrence of encephalopathy or encephalomyelitis were reported.

A detailed analysis of alternative explanations is reported below:

- 5 cases reported recent previous viral or bacterial infections (including COVID-19 infection, underlying urinary tract infection)
- 3 cases reported a relevant medical history of previous multiple sclerosis, leukoencephalopathy, meningitis or immune-mediated encephalopathy.
- 3 cases reported a medical history of breast cancer or ovarian cancer.
- 6 cases reported encephalitis or meningoencephalitis due to other causes (meningoencephalitis due to Listeria infection, encephalitis diagnosed as a secondary problem to shingles, encephalopathy secondary to systemic lupus erythematosus, HZ encephalitis and meningoencephalitis with cerebritis and sepsis due to Listeria monocytogenes infection, viral encephalitis).
- 6 cases were reported as encephalitis/ADEM but included information suggestive of alternative diagnosis (cerebritis, cerebral edema as a consequence of an earlier migraine attack, multiple sclerosis, cerebellitis).
- 2 cases reported encephalitis in the context of COVID-19 infection and anaphylaxis with a time to onset reported as the same day of the vaccination.

Of the remaining 34 cases, in 22 case reports, there was insufficient information on event details, which precludes a full assessment (event details, time to onset, medical history, concomitant medication, treatment details, no MRI, EEG or CSF data reported).

For the remaining 12 cases that did not report medical history or recent history of confounding factors, there were:

- 8 cases that were assessed as BC level 3:

- In 5 cases (AER# (b) (6) ; AER# (b) (6) ; AER# (b) (6) ; AER# (b) (6) ; AER# (b) (6)), MRI showed evidence of inflammation in the brain with time to onset that ranged between 2 days up to 38 days in a single case;
 - In 1 case (AER# (b) (6)), symptoms were possibly pre-existing pre vaccination (more than 10 kg loss within 2 months) and worsened after vaccination suggesting a possible alternative explanation. MRI was normal, pleocytosis in cerebrospinal fluid.
 - In 2 cases (AER# (b) (6) ; AER# (b) (6)), MRI was normal but there was CSF pleocytosis and elevated protein.
- 4 cases that were categorized as BC level 2:
- **AER# (b) (6)** : 34-year old female patient with no relevant medical history and no concomitant medications reported. One day after the second dose, the patient experienced headache, malaise and neck to shoulder pain. About 4 days after the vaccination, memory loss, loss of voice, ataxia, involuntary movements of the limbs were reported. Treatment with steroid was started and the patient started to recover from the events. About 12 days after the vaccination, acute disseminated encephalomyelitis was suspected. Magnetic resonance showed diffuse or multiple white matter lesions observed on T2-weighted / diffusion-weighted images or FLAIR images (with or without gadolinium enhancement on T1-weighted images) and diffuse, unclear borders, large (> 1-2 cm) lesions predominantly cerebral white matter. Cerebrospinal fluid test showed no pleocytosis and a normal protein level. The patient was recovering from all events at the time of the reporting.
 - **AER# (b) (6)** : 72-year-old male patient with no medical history and concomitant medications reported. About 11 days after the first dose of the vaccine, he developed symptoms of meningoencephalitis with somnolence, aphasia, agitation, lymphocytic pleocytosis in the cerebrospinal fluid and MRI image consistent with mild encephalopathy with reversible lesion in the splenium (MERS) (corpus callosum with lesions on MRI). Myelin oligodendrocyte glycoprotein (MOG) antibody was also detected. The patient recovered from all events at the time of the reporting.
 - **AER# (b) (6)** : 55-year-old female patient with no medical history reported and no concomitant medications who, about 30 minutes after the second vaccination, developed rotational dizziness, difficulty reading texts, and difficulty finding words. Upon arrival at the emergency room shortly after the onset of symptoms, she became confused. At the clinical examination, only slightly increased patellar reflex left was observed, otherwise neurological status was without remarks. An extensive investigation with CT brain, CT angiography cerebral and carotid arteries, MRI brain, and lumbar puncture showed encephalitis changes on an unspecified date. Other examinations turned out to be normal. The outcome of all events was unknown.

- **AER# (b) (6)**: 50-year-old male patient with no medical history and concomitant medications reported that 5 days after the second dose of the vaccination experienced fever, confusion, limb pain, diarrhea and blister appeared on forehead. The day after he experienced decreased level of consciousness, convulsions and clumsiness of the right hand. Encephalitis was detected based on clinical picture and cerebrospinal fluid sample. The encephalitis was initially reported by the consumer (patient's brother) to have been caused by the herpes virus; however, the physician later reported that the causative agent of encephalitis was not evident in the cerebrospinal fluid sample. The clinical outcome of all the events was recovering at the time of the reporting.

Cases reporting a fatal outcome:

Six cases had a fatal outcome.

Two cases were assessed as BC level 4 and four cases were BC level 5 (patient with multiple sclerosis, patient with a post-stroke epilepsy, two patients with cerebral hemorrhage).

Most cases were reported in elderly frail subjects. In one case (AER# **(b) (6)**, BC level 4) with a fatal outcome, the patient had previously compromised renal function, was taking multiple concomitant medications and reportedly experienced meningoencephalitis with no clear evidence (CSF negative, MRI not performed and EEG not supportive of encephalitis) other than age-related brain deterioration.

In another case (AER# **(b) (6)**, BC level 4) time to onset was not reported and the patient experience meningoencephalitis and listeria infection with no other details reported.

In one case (AER# **(b) (6)**, BC level 5), the patient experienced meningitis and encephalitis as a consequence of cerebral hemorrhage and after 2 months of treatment for seizures. The patient died due consequences related to cerebral hemorrhage.

In the last case (AER# **(b) (6)**, BC level 5), lumbar puncture was negative and brain CT results did not support the diagnosis of meningoencephalitis; rather the case was considered a post stroke epilepsy.

The other two cases referred to adult (non-elderly) subjects. AER# **(b) (6)** (BC level 5) referred to a 35-year-old female patient who experienced a very rare aggressive form of multiple sclerosis and died of it shortly after the diagnosis. AER# **(b) (6)** (BC level 5) referred to a 54-year-old female patient with a medical history of Pilzeus Merzbacher Syndrome who was diagnosed with a sinus vein thrombosis with intracranial stasis hemorrhage and thrombocytopenia a few days after vaccination.

4. OBSERVED VERSUS EXPECTED ANALYSIS OF SPONTANEOUSLY REPORTED EVENTS

The MAH conducted unadjusted observed to expected ratio (O/E) analyses for the 78 reported ADEM cases. The O/E ratio was below 1 for both the 21-day risk window and no

risk window, indicating there was not an increased risk of ADEM among recipients of the BNT162b2 vaccine.

Table 5. Observed versus Expected (O/E) Analysis of 78 Spontaneously Reported Acute Disseminated Encephalomyelitis Cases through 10 May 2021

	21-Day Risk Window (12,398,436 PY ^a)	No Risk Window (34,796,539 PY)
O/E ratio (95% CI)	0.119 (0.094, 0.148)	0.042 (0.033, 0.053)
Expected cases ^b	657	1,844

a. PY through 09 May 2021

b. Derived from 5.3 per 100,000 PY background rate (Willame, 2021)

In this analysis, expected case counts were derived using a background incidence rate of 5.3 per 100,000 person years from the ADVANCE project, which includes ADEM, encephalitis, encephalomyelitis, and encephalopathy, previously used in earlier SMSRs ¹⁶.

In the April 2021 SMSR report, the MAH used a background rate of 0.1 from the ACCESS initiative ¹⁷. The ACCESS background rate is derived from medical records coded as ADEM only. The use of the 5.3 per 100,000 person years background rate is justified to better align with the spontaneously reported case definition, which includes PT codes for acute disseminated encephalomyelitis, encephalitis, encephalopathy, and encephalomyelitis. Person years of exposure estimates were derived from publicly available information reported by countries where the BNT162b2 vaccine is authorized ¹⁸. For periods when more than one vaccine brand was authorized for use in each country, the doses administered were assumed to be divided equally by the number of brands of vaccines authorized. The estimate of administered doses does not reflect exposure in persons vaccinated in countries that did not publicly report.

O/E ratios were calculated using a 21-day risk window and no risk window. However, the 21-day risk window was not applied to the observed case count; all 78 cases were included in the numerator regardless of the duration between vaccination and event onset date.

Several limitations of the observed to expected comparison must be noted. With respect to observed cases, case ascertainment through the spontaneous reports likely reflect an underreporting due to incomplete reporting or a lag in reporting. Additionally, spontaneous surveillance systems are prone to reporting bias whereby events that have been previously identified as potentially related to the vaccine are more likely to be reported despite not meeting the clinical definition. Conversely, events that have not been previously associated with a vaccine are likely to be underreported.

With respect to the expected case counts, estimates concerning both exposure to vaccine and the background rate have limitations. Our exposure estimate assumes that the number of reported administrations is complete and accurate when in fact not all countries administering vaccine have reported counts of vaccine administration to the data source. Thus, the exposure is underestimated.

The expected count also assumes that the expected incidence rate in the vaccinated population is the same as that in the population used to calculate the background rate. However, it is possible that the delivery of health care, population demographics, and underlying health status of the population used for the background rate estimate differ from those expected in the vaccinated population. To date, the United States contributes the most exposure data.

A final limitation concerns the risk window, the period during which one is expected to be at risk of a given event if there is a causal association between the event and the vaccine. Two periods, 21 days and no risk window, were selected to provide an estimate assuming a more acute onset (21-day window) and a more latent onset (no risk window). The 21-day risk window is particularly conservative as all observed cases are included in the numerator of the O/E ratio regardless of the days since vaccination dose, which will lead to an overestimation of the ratio if observed cases occurred outside of the risk window.

5. DISCUSSION

There were 78 reports that met the initial search criteria. Among them, three cases were not considered relevant for the analysis (a duplicate case and a case not reporting a PT suggestive of encephalitis or encephalomyelitis) and 16 cases met BC level 5 signifying that they were not ADEM/encephalitis cases.

Of the remaining 59 reports, none met the BC Level 1, 7 met the BC Level 2, 11 met BC level 3 and 41 were assessed as BC level 4, meaning that they reported encephalitis or ADEM with insufficient evidence to meet the case definition.

In the context of the cases that met BC level 3 (11 cases) or level 2 (7 cases) certainty, there were several reporting significant confounding factors (e.g. 1 case with a medical history of recent confirmed infection, 2 cases with a medical history of cancer, 1 case with a medical history of encephalitis and seizure, 1 case with medical history of epilepsy). Furthermore, in 6 cases, encephalitis was suspected to be either of viral or post-viral origin such as infectious VZV meningoencephalitis or HZ encephalitis or due to underlying encephalitis (reported in the medical history). Only in 4 cases, MRI and CSF showed evidence of brain inflammation but it should be considered that an alternative aetiology of the disease was postulated (HZ encephalitis) in one case and in another one, time to onset was implausible for the clinical manifestation of the disease (30 min after second vaccination). For the remaining two cases, time to onset was reported as 11 days after the first vaccination dose in one case and in the other one, the reporter stated that the possibility of psychotic episode or symptomatic epilepsy could not be ruled out.

6. SUMMARY AND CONCLUSION

Most reported cases (76%) met level 4 and 5 of BC. Most cases meeting BC level 2 or 3 were confounded by preceding infection, implausible time to onset, symptoms pre-existing vaccination or alternative diagnosis available. In many cases, the information reported was not sufficient to fully assess the case. Among the 6 cases reporting a fatal outcome there were 5 cases that met BC level 5 and 2 cases that met BC level 4. Cause of death when specified, was

090177e19749cf15\Approved\Approved On: 14-Jun-2021 14:01 (GMT)

reported as multiple sclerosis in one case and as meningoencephalitis and listeria infection in another one.

The upper limit of the 95% confidence interval for the revised observed to expected ratio did not exceed 1.

Overall, given the totality of the available information, this review of the data did not support validation of a signal. Changes in the risk minimization measures or updates to the product information label are not warranted at this time. The benefit risk profile of the vaccine remains favorable. The topic will continue to be closely monitored.

APPENDIX 3.4 SAFETY EVALUATION OF HEPATIC EVENTS

1. INTRODUCTION

As per the Assessment Report for the 5th Monthly Safety Update - Post-Opinion Measure 002.4: *“The results of the review of Hepatic events is lacking in current MSSR. The MAH is requested to report the results of the review of Hepatic events as this is considered a non-validated safety signal in the 5th MSSR.”*

Method

The Pfizer safety database was searched for all BNT162b2 vaccine cases received through 28Feb2021 for PTs within HLTs: Hepatic failure and associated disorders; Hepatic fibrosis and cirrhosis or SMQs: Hepatic failure, fibrosis and cirrhosis and other liver damage-related conditions; Hepatitis, non-infectious.

2. RESULTS

Based on the search strategy provided above, a total of 27 cases were retrieved. There were 22 females and 5 males. Twenty-six (26) cases were reported as serious and 1 as non-serious. Cases originated mainly from the United Kingdom (8), the United States (6), and France (5).

Age's distribution was as following: 18-30 years (2); 31-50 years (3); 51-64 years (6); 65-74 years (8); Greater than or equal to 75 years (7), and age was unknown in 1 case (mean = 65.3 years; n = 26).

A total of 27 cases reporting the following PTs from the search: Liver injury (7), Ascites (5), Hepatocellular injury (4), Hepatic cirrhosis, Hepatic failure, Liver disorder (3 each), and Cholestatic liver injury, Gastric varices haemorrhage (1 each).

Out of 27 cases, 5 cases provided limited information on latency, duration of the relevant event, medical history, and co-suspect/concomitant medications precluding a meaningful conclusion on causality; in 1 other case, the hepatic event was noted as “occurring at one point of time during the year” (had no association with vaccination). Out of remaining 21 cases, 9 cases reported a pre-existing history of hepatic disorder and/or cancer patients on chemotherapy and/or chronic kidney disorder/immunosuppression. Other 2 cases reported hepatic events in association with development of Epstein Barr Virus (EBV) infection after vaccination.

Out of the remaining 10 cases, 6 cases co-reported many reactogenicity events occurring on day of or next day of the vaccination and an onset of hepatic events starting with an increase in hepatic enzymes occurring in 7-8 days after vaccination day (2 cases); 9 days (1 case); 13 days (1 case); and unknown latency (2 cases; one of this cases reported “something weird with the liver”). The co-reported events in these 6 cases were: Pyrexia, Headache (3 each), C-reactive protein increased, Malaise, Nausea, Fatigue, Hypotension (2 each), Pain in

extremity, Arthralgia, Chills, Hot flush, Loss of consciousness, Decreased appetite, Memory impairment, pH urine increased, Anaemia, Somnolence, Systemic inflammatory response syndrome Lymphopenia, Asthenia, Food aversion, Vomiting, Ear pain, Pain in jaw, Inflammation, Tooth infection, Movement disorder (1), Balance disorder (1), and Limb immobilization (1 each).

The last four cases were fatal cases. One was a limited case of a 95-year-old female, with unknown medical history and co-suspect/concomitant medications. The patient experienced fatigue and cold shivers on the vaccination day; cystitis, general malaise, liver failure leading to death, all 3 days later. The second case reported a 26-year-old male with a complex medical history of COVID-19 pneumonia from 3 months prior to Dose 1 (bilateral pneumonia, no mechanical ventilation, confirmed by PCR), esophageal candidiasis in 2015, pollen allergy and asthma in 2008, mononucleosis in 2015, tuberculous pneumonia (any form) in 2003, Herpes zoster on 03Jun2011, Pharyngotonsillitis in 2015, on many concomitant medications including steroids. The patient started with symptoms of pharyngotonsillitis on 31Jan2021 and received various antibiotic treatments: amoxicillin-clavulanic, cefditoren. He developed respiratory failure and increased transaminases. On 04Feb2021 there was an evolution with liver failure, refractory shock, hepatitis acute, suspected hemophagocytic syndrome, multiple organ failure. These events were reported as serious as required hospitalization. The patient died on 07Feb2021 due to above mentioned events. The last two cases reported a 70-year-old and 85-year-old patients with very complex medical histories on many concomitant medications (an autopsy for the 1st patient identified atherosclerotic coronary artery disease with occlusion of the proximal circumflex branch with rupture and bleeding in the atheroma plaque with stenosis as well as an acute myocardial infarction in the left ventricle with signs of older infarction; bilateral pneumonia and diffuse acute circulatory stasis, an abdomen with presence of sigmoidal volvulus with general dilation of the intestines and inflated ventricle as well as 150 ml of ascites; ileum with signs of ischemia and small hemorrhages in the mesotarm; and multinodous colloid goiter; and the cause of death in the 2nd patient was an acute myocardial infarction 5 days post-dose 1).

3. CONCLUSION

Considering the totality of the data, including the number of reports received in the context of the millions of doses of vaccine administered and based on the available data, this safety topic was determined not to be a validated signal.

APPENDIX 3.5 SUMMARY OF CASES OF THROMBOEMBOLISM WITH THROMBOCYTOPENIA

1. BACKGROUND

Pfizer/BNT COVID-19 vaccine AE reports of arterial or venous thromboses and concurrent thrombocytopenia are being closely monitored due to recent information that the co-occurrence of such events may be a risk of vaccination with adeno-vector COVID-19 vaccines.

The Pfizer safety database was searched for spontaneous BNT162b2 reports cumulative to 26 May 2021 using MedDRA (v 24.0) for cases within the SMQ Embolic and thrombotic events where the thrombosis/embolic PT occurred from Day 3 to Day 28 (inclusive) following vaccination with BNT162b2. That dataset was then searched for PTs that are in either the HLT Thrombocytopenias or HLT Platelet analysis. The rationale for this search strategy is based on discussion with internal hematologists and review of the available literature on the topic, including the Vaccine Induced Immune Thrombotic Thrombocytopenia (VITT) Diagnostic Flow Chart published by the International Society on Thrombosis and Haemostasis and updated on 20 Apr 2021 (ISTH, www.isth.org).

The final dataset is comprised of 85 AE reports, compared to 33 AE reports in the safety database as of 22 April 2021, that were described in the 5th SMSR.

The cases were individually reviewed and categorized into Brighton Collaboration Levels 1-5 using the Decision tree algorithm for case-finding of Thrombocytopenia Thrombosis Syndrome (TTS)ⁱ as follows:

1. BC Level 1: Definite case TTS – 40 reports
2. BC Level 2: Probably case TTS – 2 reports
3. BC Level 3: Possible case TTS – 5 reports
4. BC Level 4: Excluded case; reported as TTS but insufficient evidence to meet any level of the case – 12 reports
5. BC Level 5: Not a case of TTS – 26 reports

2. BRIGHTON COLLABORATION LEVELS 1-3 AND POTENTIAL VITT

The 47 cases assessed as BC Levels 1-3 were then reviewed for information potentially indicative of a possible new syndrome that has been referred to as Vaccine-Induced Immune Thrombotic Thrombocytopenia (VITT). The VITT Diagnostic Flow Chart (updated 20 Apr 2021) and published by the International Society on Thrombosis and Haemostasisⁱⁱ was

utilized. Case information taken into account included signs and symptoms of thrombosis occurring in the setting of prior COVID-19 vaccination (4-28 days prior), a platelet count of $<150 \times 10^9/L$, reliable immunoassay results for platelet factor 4 (PF4) antibodies (e.g. ELISA, particularly if the optical density reading is high), markedly elevated D-dimer levels (e.g. $>4 \times$ the threshold for venous thromboembolism exclusion).

2.1. BC Level 1 reports

Of the 59 BC Level 1-4 reports, 40 were BC Level 1. All reports were serious. Patients ranged in age from 22 to 96 years of age (mean 69.3, median 73); there were 26 male and 14 females, and all but 1 of the reports were medically confirmed. Of the cases with information on dosing, 22 cases occurred after dose 1 and 15 after dose 2; the relevant events (thrombosis and thrombocytopenia) occurred from 1 to 27 days after vaccination.

2.1.1. BC Level 1 reports with PF4 + and/or D-dimer >4000

Of the 40 BC Level 1 reports, 2 described the presence of PF4 antibodies (Table 1) and an additional 10 reports described D-dimer results >4000 (Table 2).

Of the 2 PF4 antibody + reports, one described a 31-year-old man with no significant medical history reported and one described a 47-year-old woman with a history of pulmonary embolus.

Of the 10 D-dimer >4000 reports, medical histories were confounding in 9 of the reports: One described a 78 year old man who had endovascular surgery (abdominal aortic aneurysm repair) and post-operative heparin 11 days prior to the development of thrombocytopenia and 14 days prior to the development of abdominal aortic and renal artery thrombosis; 3 described patients with cancer diagnoses (2 of the 3 with previous VTEs, 1 of the 3 improved on heparin); 1 described chronic right heart failure with liver congestion; 1 had baseline thrombocytopenia; 1 had cirrhosis (due to alcohol) and portal hypertension; 1 had ischemic heart disease and was found to be in atrial fibrillation; and 1 had a history of atrial fibrillation (fatal case).

Table 1. BC Level 1 Reports with PF4 Antibodies Positive

	AER number Country Age/Sex Initial Receipt Date	Preferred Terms reported	Vaccine Dose (1 or 2) Time to onset from vaccine dose	Additional relevant information
1	(b) (6) UK 31 years/Male 20 May 2021 Recovering/Recov ered	Deep vein thrombosis, Thrombocytopenia, Deep vein thrombosis, Peripheral swelling, Joint swelling	1 5 days	Pt without significant medical history or known risk factors for thrombus developed lower extremity DVT. Platelets 135, D-dimer 12,819, Fibrinogen 3.6, PF4 antibodies positive (HIT assay used), COVID-19 test negative. The case was reviewed by a hematologist. The patient was started on non-heparin anticoagulation and was recovering
2	(b) (6) UK 47 years/Female 11 Apr 2021 Not recovered	Haemorrhage, Thrombosis, Embolism, Arterial thrombosis, Venous thrombosis, Cerebral venous sinus thrombosis, Cerebral haemorrhage, Chest injury, Thrombocytopenia, Abdominal pain, Muscular weakness	1 9 days	Pt with a history of pulmonary embolism and normal platelet count who was reported to be on an unspecified anticoagulant or anti- platelet medication, presented with abdominal pain and left-handed weakness 9 days after vaccination and 12 days after vaccination had multiple arterial and venous thromboses not further characterized other than a CVST with a secondary bleed. She had a platelet count of 11 (nadir 10), Fibrinogen 4.4, D-dimer 20,000, PF4 antibodies positive (ELISA). She was seen by a hematologist and received IVIg but no anticoagulant.

090177e19749cf15\Approved\Approved On: 14-Jun-2021 14:01 (GMT)

Table 2. BC Level 1 Reports with D-dimer >4000 (and no PF4 antibody results)

	AER number Country Age/Sex Initial Receipt Date Outcome of thrombosis/thrombocytopenia	Preferred Terms reported	Vaccine Dose (1 or 2) Time to onset from vaccine dose	Additional relevant information
1	(b) (6) Netherlands 78 years/Male 10 May 2021 Recovering/Not recovered	Thrombocytopenia, Aortic thrombosis, Renal artery thrombosis, Renal ischaemia, Intestinal ischaemia	2 11 days	Pt with history of hypertension and abdominal aortic aneurism repair (tolerated heparin perioperatively) had thrombocytopenia treated with IV Ig and dexamethasone and 3 days later had an abdominal aortic thrombus, renal artery thrombosis, intestinal ischemia and renal ischemia on CT scan. Platelets 25, Heparin-induced thrombocytopenia test was positive, PF4 antibodies by ELISA were negative, D-dimer was >5000.
2	(b) (6) UK 69 years/Male 09 May 2021 Recovered	Embolism, Deep vein thrombosis, Thrombocytopenia, Pain, Peripheral swelling, Pain in extremity	2 5 days	Pt with history of hypertension, alcoholic cirrhosis and portal hypertension on multiple medications, presented with leg pain and swelling 5 days after vaccination and was found to have a DVT on ultrasound. Platelets 129, D-dimer 4336, PTT 50.6, Unknown if PF4 antibodies were identified. He was treated with a non-heparin anticoagulant and recovered to be discharged home

090177e19749cf15\Approved\Approved On: 14-Jun-2021 14:01 (GMT)

Table 2. BC Level 1 Reports with D-dimer >4000 (and no PF4 antibody results)

	AER number Country Age/Sex Initial Receipt Date Outcome of thrombosis/thro mbocytopenia	Preferred Terms reported	Vaccine Dose (1 or 2) Time to onset from vaccine dose	Additional relevant information
3	(b) (6) Spain 75 years/Male 07 May 2021 Recovered	Thrombocytopenia, Pulmonary embolism, Deep vein thrombosis, Obstructive shock, Syncope, Sinus bradycardia, Atrial fibrillation, Right ventricular dilatation, Systolic dysfunction, Hypotension, Heart rate increased, Incorrect route of product administration	1 5 days	Pt with a history of ischemic heart disease and baseline thrombocytopenia (123), medications not reported. Presented with complaint of weakness followed by syncope while working in the fields and was found to be in atrial fibrillation (rate 150). Due to elevated D-dimer (7300) and low oxygen saturation, a CT angiogram of the pulmonary arteries was performed and pulmonary embolism with right cardiac overload was diagnosed. He had thrombolysis with Actilyse and improved. A left popliteal DVT was found on ultrasound. His atrial fibrillation was treated with digoxin and bisoprolol. He was maintained on low molecular weight heparin and acenocoumarol. Platelet nadir 55, COVID test negative.
4	(b) (6) UK Unspecified/Male 06 May 2021 Not resolved/Unknow n	Deep vein thrombosis, Thrombocytopenia, Haemorrhage	2 14 days	Pt with history of varicose veins and report of platelet count <150 before vaccination was diagnosed with femoral-popliteal DVT via ultrasound. Platelets 132, D-dimer >4000, Fibrinogen 223, unknown if PF4 antibodies were identified. No hemorrhage was identified. Treatment was not specified; patient was to f/u with hematologist in 3 months.
5	(b) (6) Spain 78 years/Female 03 May 2021 Not recovered	Pulmonary embolism, Respiratory failure, Right ventricular dysfunction, Cardiac failure, Metabolic acidosis, Hyperlactacidaemia, Renal impairment, Hepatic function abnormal, Hepatic cytolysis, Thrombocytopenia	Unspecifie d 16 days	Pt with a history of hypertension, spondylarthrosis, osteopenia, chronic right-sided heart failure with liver congestion, presented to hospital due to dizziness and malaise, she was in respiratory distress and a CT scan showed extensive bilateral pulmonary thromboses with right ventricular dysfunction. She received fibrinolysis with a good response and was on heparin for a brief time before being placed on fondaparinux and Flebogamma IV. Platelets 78, Fibrinogen 292 mg/dl, D-dimer 36,191

Table 2. BC Level 1 Reports with D-dimer >4000 (and no PF4 antibody results)

	AER number Country Age/Sex Initial Receipt Date Outcome of thrombosis/thro mbocytopenia	Preferred Terms reported	Vaccine Dose (1 or 2) Time to onset from vaccine dose	Additional relevant information
6	(b) (6) UK 86 year/Female 29 Apr 2021 Recovered	Haemorrhage, Deep vein thrombosis, Thrombosis, Thrombocytopenia, Deep vein thrombosis, Lymphocytosis, Peripheral swelling, Peripheral swelling	2 13 days	Pt with a history of Parkinson's disease on levodopa, developed left leg swelling 13 days after vaccination and was found to have a DVT above the knee on ultrasound. Her labs included PTT 25.2, PT 11.2, D-dimer 11,635, Platelets 95, PF4 antibodies sent but pending at time of report. She was started on rivaroxaban. It is unclear why Hemorrhage was coded as an AE.
7	(b) (6) UK Unspecified/Male 29 Apr 2021 Recovering/Unkn own	Pulmonary embolism, Thrombocytopenia, Hepatic cancer	2 6 days	Pt with medical history and medications not reported, had a pulmonary embolism 6 days after Dose 2 of vaccine diagnosed via CT pulmonary angiogram. Platelet count was <150, D-dimer >4000 and COVID test negative. He was found to have malignant lesions in the liver on CT scan (not further described).
8	(b) (6) Netherlands 73 years/Male 19 Apr 2021 Not resolved/Unknow n	Deep vein thrombosis, Thrombocytopenia	1 8 days	Pt with a history of pulmonary embolism in 1999, prostate carcinoma, hydronephrosis, urolithiasis and myocardial infarction on multiple medications had a left leg DVT (on ultrasound) and platelets count 145 8 days following vaccination. D-dimer 9881. The patient was treated with rivaroxaban.
9	(b) (6) France 76 years/Female 29 Mar 2021 Recovering/Unkn own	Pulmonary embolism, Thrombocytopenia, Dyspnoea	2 19 days	Pt with history of hypertension, lower extremity thromboses, obesity and breast cancer thought to be in remission as of Aug 2019 presented with shortness of breath. She was found to have a PE and platelet count of 135. D-dimer was >20,000. She was treated with low molecular weight heparin and improved.

Table 2. BC Level 1 Reports with D-dimer >4000 (and no PF4 antibody results)

	AER number Country Age/Sex Initial Receipt Date Outcome of thrombosis/thro mbocytopenia	Preferred Terms reported	Vaccine Dose (1 or 2) Time to onset from vaccine dose	Additional relevant information
10	(b) (6) Belgium 83 years/Male 03 May 2021 Fatal case	Death, Pulmonary embolism, Acute kidney injury, Thrombocytopenia, Hemiplegia, Ischaemic stroke, International normalised ratio increased, Dyspnoea	1 26 days	Pt with a history of hypertension and atrial fibrillation on several medications including acenocoumarol presented with left hemiplegia and dyspnea and was found to have a stroke and pulmonary embolism on thoracic and cerebral CT angiogram. Platelets were 80, INR was 2.45, D-dimer 7650 mg/ml. He had fibrinolysis with alteplase due to hemodynamic instability and a mechanical thrombectomy however he died the following day.

2.1.2. Fatal BC Level 1 reports

Seven of the 40 BC Level 1 reports were fatal cases (Table 3). None of the reports contained information about PF4; 1 report described a D-dimer level >4000 (AER (b) (6)).

Table 3 BC Level 1 Reports - Fatal Cases

	AER number Country Age/Sex Initial Receipt Date Outcome (thrombosis/thrombocytopenia)	Preferred Terms reported	Vaccine Dose (1 or 2) Time to onset from vaccine dose	Additional relevant information
1	(b) (6) UK 85 years/Male 09 Apr 2021 Fatal case	Cerebrovascular accident, Platelet count decreased	1 7 days	Pt with a history of gastrointestinal bleed, atrial fibrillation taking digoxin, finasteride, furosemide, salbutamol, solifenacin, tamsulosin and rivaroxaban which was recently stopped due to a GI bleed. The patient presented with a middle cerebral artery stroke 7 days after vaccination and an unspecified platelet count less than 150. The patient died 7 days after the stroke. No PF4 antibodies, D-dimer or Fibrinogen provided. The patient has known risk factors for ischemic stroke and unknown severity of thrombocytopenia. Cause of death was noted as stroke.
2	(b) (6) France 72 year/Male 19 April 2021 Fatal case	Disseminated intravascular coagulation, Thrombosis, Thrombocytopenia, Cerebral haemorrhage, Hypernatraemia, Hyperchloraemia, Lymphopenia, Rhabdomyolysis, Prothrombin level abnormal, Activated partial thromboplastin time abnormal, Malaise, Fall	1 14 days	Pt with a history of atrial fibrillation, hypertension and chronic intoxication taking bisoprolol and rivaroxaban was found on the ground, face down. He was diagnosed with pancreatitis grade D and lab abnormalities including a platelet count of 34 and CPK>8000, Fibrinogen 0.74 and intracardiac, aortic and arm and leg arterial thromboses. Cause of death was noted as cerebral hemorrhagic "rearrangement," DIC, multiple thromboses and thrombocytopenia.

Table 3 BC Level 1 Reports - Fatal Cases

AER number	Country	Age/Sex	Initial Receipt Date	Outcome (thrombosis/thrombocytopenia)	Preferred Terms reported	Vaccine Dose (1 or 2)	Time to onset from vaccine dose	Additional relevant information
3	(b) (6)	Spain	83 year/Male	26 Apr 2021	Fatal case	Cerebral thrombosis, Hemiplegia, Dizziness, Oedema peripheral, Gait disturbance, Nervous system disorder, Somnolence, Pupils unequal, Eyelid ptosis, Facial paresis, Dysarthria, Platelet count decreased, White blood cell count increased, Neutrophil count increased, Lymphocyte count decreased, Pyrexia	2 12 days	Pt with a history of high cholesterol, non-stenotic aortic sclerosis, diabetes, hypertension and cirrhosis on multiple medications was admitted after a few episodes of falling, with dysarthria, anisocoria and left hemiplegia. CT angiogram of brain showed cerebral arterial thrombosis. Platelet count was 129, Fibrinogen was 766, COVID-19 test was negative. He was treated with enoxaparin and mechanical thrombectomy. He developed a fever, leukocytosis and elevated CRP and a possible respiratory infection was noted. He died 26 days after dose 2 and it was not reported if an autopsy was done.
4	(b) (6)	Poland	73 years/Male	05 Apr 2021	Fatal case	Acute kidney injury, Acute myocardial infarction, Thrombocytopenia, Pancreatitis acute	1 9 days	Pt with a history of coronary artery disease, hypertension and degenerative joint disease taking ramipril and lercanidipine HCl presented with acute renal failure, a transmural MI, acute pancreatitis, and thrombocytopenia (nadir 131) and died the same day. It was noted that baseline cause of death (COD) was pancreatitis, secondary COD was acute renal failure and direct COD was MI. An autopsy was not performed. The course of events (multiorgan failure) described are more likely attributable to pancreatitis than a rarer syndrome of thrombotic thrombocytopenia.

AER number Country Age/Sex Initial Receipt Date Outcome (thrombosis/thrombocytopenia)	Preferred Terms reported	Vaccine Dose (1 or 2) Time to onset from vaccine dose	Additional relevant information
5 (b) (6) Belgium 83 years/Male 03 May 2021 Fatal case Report also included in Table 2	Death, Pulmonary embolism, Acute kidney injury, Thrombocytopenia, Hemiplegia, Ischaemic stroke, International normalised ratio increased, Dyspnoea	1 26 days	Pt with a history of hypertension and atrial fibrillation on several medications including acenocoumarol presented with left hemiplegia and dyspnea and was found to have a stroke and pulmonary embolism following thoracic and cerebral CT angiogram. Platelets were 80, INR was 2.45, D-dimer 7650 mg/ml. He had fibrinolysis with alteplase due to hemodynamic instability and a mechanical thrombectomy however he died the following day.
6 (b) (6) France 68 years/Female 06 May 2021 Fatal case	Abdominal wall haematoma, Shock haemorrhagic, Hepatic infarction, Portal vein thrombosis, Abdominal pain upper, Thrombocytopenia	2 23 days	Pt with history of chronic renal failure on hemodialysis, rheumatoid arthritis, hypertension on multiple medications presented with upper abdominal pain for about 1 week and was found on MRI to have liver ischemia with portal venous vein thrombosis. She had a platelet count of $40 \times 10^9/L$, anti-PF4 antibodies negative, coagulation factors normal and fibrinogen normal. She was initially treated with heparin, then danaparoid, then heparin again. On the 6 th day of hospitalization, she developed a large abdominal wall hematoma and received 2 units of packed red cells and 2 units of fresh frozen plasma. Platelet count was 133 G/L, recovering. Two days later however, she died due to the hematoma, hemorrhagic shock, hepatic infarction and portal vein thrombosis. It was not known if an autopsy was performed

Table 3 BC Level 1 Reports - Fatal Cases

AER number	Country	Age/Sex	Initial Receipt Date	Outcome (thrombosis/thrombocytopenia)	Preferred Terms reported	Vaccine Dose (1 or 2)	Time to onset from vaccine dose	Additional relevant information
7	(b) (6)	UK	55 years/Male	16 April 2021	Fatal case	Intestinal ischaemia, Mesenteric vein thrombosis, Hypotension, Abdominal pain, Tachycardia, Thrombocytopenia	1 27 days	Pt with history of congenital malrotation of his gut, large colon adenoma and no medications reported developed worsening abdominal pain with eating. A hemicolectomy was performed to remove the adenoma and post-operatively had worsened abdominal pain and hypotension. He returned to the OR and was found to have small bowel ischemia with abnormalities in venous drainage (no superior mesenteric vein and dilated inferior mesenteric vein). He developed a low platelet count while in the ICU ($35 \times 10^9/L$) and died 4 days later. It was not known if D-dimer was >4000 or if anti-PF4 antibodies were identified. COVID-19 test was negative. He had no history of autoimmune disease or previous reaction to heparin. On autopsy, he had mesenteric vein thrombosis and intestinal ischemia.

2.2. BC Level 2 reports

Both of the level 2 reports (“probable TTS”) described D-dimer levels >4000 . Both reports were in elderly women and one was consistent with the diagnosis of thrombotic thrombocytopenic purpura rather than potential VITT.

Table 4. BC Level 2 Reports (D-dimer >4000)

AER number	Preferred Terms reported	Vaccine Dose (1 or 2)	Additional relevant information
Country			
Age/Sex			
Initial Receipt Date			
Outcome (thrombosis/thrombocytopenia)		Time to onset from vaccine dose	
1 (b) (6)	Nausea,	2	Pt with history of tachycardia, nausea,

Recovering	shortened,		(nadir 9), RBC fragmentation and
	Thrombotic		ADAMTS13 levels that were
	thrombocytopenic		undetectable. D-dimer was >4000. It
	purpura, Neurological		was reported that PF4 antibody testing
	symptom		was not indicated.

2.3. BC Level 3 reports

There were 5 BC Level 3 reports (“possible TTS”); all serious. Patients ranged in age from 44 to 82 years of age (mean 68.3, median 74); there were 4 males and 1 female, and all reports were medically confirmed. Four (4) reports occurred after dose 2 and 1 occurred after dose 1; time to onset or the relevant events (thrombosis and thrombocytopenia) occurred from 10 to 22 days after vaccination. Of the 5 reports, one was a fatal case of severe pneumonia in an elderly man with pulmonary fibrosis and 1 described a 44-year-old man with a D-dimer >4000; these 2 reports are detailed in Table 5.

Of the 3 remaining reports, one described a heparin-treated man with an MI and a decrease in 2 cell lines (platelets and WBC), one described an elderly woman with no medical history reported who had bilateral PEs (no imaging study noted) and thrombocytopenia and one

described a man of unspecified age who had a history of COVID-19, decreased platelets and PE who was reported to have a DVT and thrombocytopenia (nadir 129) but PF4 antibody test (ELISA) negative, 22 days after dose 2 of the vaccine.

Table 5. BC Level 3 Reports (Fatal or D-dimer >4000)

	AER number Country Age/Sex Initial Receipt Date Outcome (thrombosis/thrombocytopenia)	Preferred Terms reported	Vaccine Dose (1 or 2) Time to onset from vaccine dose	Additional relevant information
1	(b) (6) Norway 75 years/Male 15 Apr 2021 Fatal case	Pneumonia, Thrombocytopenia, Respiratory failure, Depressed level of consciousness, Hemiplegia, Cerebral thrombosis	2 20 days	Pt with a history of pulmonary fibrosis presented with a severe pneumonia. He was treated with antibiotics however, after 2 days he had a depressed level of consciousness and developed thrombocytopenia (nadir 60) and hemiplegia due to a cerebral thrombosis. COVID-19 PCR test was negative. ICU care was stopped due to his poor prognosis and the patient died of respiratory failure.
2	(b) (6) UK 44 years/Male 20 May 2021 Recovered with sequelae/Not recovered	Pneumonitis, Chest pain, Thrombocytopenia, Thrombophlebitis, Thrombocytopenia, Pulmonary thrombosis, Peripheral swelling, Pain in extremity, Off label use, Inappropriate schedule of product administration	2 14 days	Pt with a history of urticaria and no medications reported presented with chest pain, pneumonitis and “aggravated” thrombocytopenia (nadir 69). It was reported that he had a “clot” in his lung and leg thrombophlebitis. He had a CT pulmonary angiogram and US (unspecified) and a negative COVID-19 test. Anti-PF4 antibodies were reported as unknown, D-dimer was unspecified but reported as >4000.

3. CONCLUSION

It is not unexpected that reports of TTS following vaccination are continuing to be reported as vaccinations continue, especially in light of the multiple communications to healthcare professionals from health authorities and specialty medical organizations to remain alert and to report all possible cases temporally associated to COVID-19 vaccinations. A mechanism of action for the occurrence of TTS following adenovirus vector COVID-19 vaccines has been postulated, but it has not been confirmed. TTS can occur in clinical scenarios other than post-COVID-19 vaccinations (e.g. TTP, sepsis and autoimmune disease). And many of the reports of TTS received as of 26 May 2021, have confounding factors. Regardless of this, and of the stimulated reporting that may be occurring, only 2 cases of TTS with positive PF4

antibody tests have been reported. At this time, considering the hundreds of millions of doses of Pfizer/BNT COVID-19 vaccine administered, it cannot be concluded that the vaccine is causally associated with the condition referred to as VITT.

In the Final Assessment Report for the 5th Monthly Safety Update for Comirnaty, the following request was made to Pfizer:

Regarding TTS, with the exception of (b) (6), no MAH evaluation of the cases identified by the EMA Eudravigilance TTS query dated 13 April was provided in response to the previous 4th MSSR (Q8). This is not accepted. The MAH should provide an evaluation of these cases.

The Assessor makes reference to the following cases that were noted in the Assessment Report of the 4th Monthly Safety Update for Comirnaty, Annex 6:

1.	(b) (6)	2.	(b) (6)
3.	(b) (6)	4.	(b) (6)

The remaining 11 cases were retrieved from the Pfizer safety database (as of 26 May 2021) and are discussed below.

Table 2. Remaining Eudravigilance Cases

	EMA Reference	Pfizer AER PTs reported	Pfizer Summary
1	(b) (6)	(b) (6) Immune thrombocytopenia, Transaminases increased	22-year-old man with no relevant medical history taking no medications developed a petechial rash over his chest and back and gingival bleeding 3 days after 1 st vaccination. A platelet count 2 months prior was 145 x 10 ⁹ /L (ref 140-400). He was found to have severe thrombocytopenia (nadir 1). Hematology was consulted and diagnosed ITP. A viral panel for HIV, HBV, HCV and EBV was negative, COVID-19 test was negative; immunologic studies were done and Sjogren's Syndrome A antibody was elevated (2.8, normal is <1 AI), Complement C3 was normal and C4 was low (10.9, ref 16-38 mg/dL) he was treated with IVIG, platelet transfusion and high dose steroids. He remained hemodynamically stable and was discharged with a platelet count of 28 after 3 days. On Day 11, platelet count was 173 and plasma IIb/IIIa and Ia/Iia platelet autoantibodies were positive. On day 34, Sjogren's antibody and complement C4 had normalized. No clear alternative explanation for this patient's thrombocytopenia was found, although he had mild transient transaminitis and immunologic lab findings that normalized. There is no report of thrombosis in this case.

Table 2. Remaining Eudravigilance Cases

	EMA Reference	Pfizer AER PTs reported	Pfizer Summary
2	(b) (6)	(b) (6) Myelosuppression, Pancytopenia, Renal tubular necrosis, Thrombotic microangiopathy, Myalgia	33-year-old woman with a reported history of myalgia taking metamizole and paracetamol received dose 1 of vaccine on 09 Jan 2021 and experienced myalgia and urticaria. She received the dose 2 on 30 Jan and 3 days later she had intense myalgia and was treated with metamizole 575 mg tid, alternating with ibuprofen 600 mg and paracetamol. She then presented to the emergency department and was found to have pancytopenia and acute renal "lesion." Labs were not provided. Thrombotic microangiopathy was suspected and she started plasmapheresis and hemodialysis. A renal biopsy showed acute tubular necrosis which the reporting HCP thought may be due to ibuprofen but could not completely rule out a relationship to the vaccine. Outcome of myalgia and microangiopathy were unknown. Other events recovered. There is no lab reports demonstrating thrombocytopenia or biopsy evidence of thrombosis in this case.
3	(b) (6)	(b) (6) Thrombotic thrombocytopenic purpura	A 33-year-old woman with a history of relapsing remitting multiple sclerosis (treated with alemtuzumab in 2016 and 2017), gallstones, obesity and fibromyalgia received dose 1 of vaccine and 29 days later was hospitalized for suspicion of thrombotic thrombocytopenia purpura. She had no headache so CVST was not suspected. A COVID-19 test was negative. ADAMTS-13 was < 5%. She was treated with methylprednisolone 500 mg daily for 3 doses, plasma exchange, rituximab 900 mg for 4 doses and caplacizumab 10 mg daily for an unspecified time. While the ADAMTS-13 level is consistent with TTP, testing for antibodies directed at it may help determine whether it was congenital or acquired. It is not clear in this case what symptoms the patient experienced, the severity of thrombocytopenia or the location of any thromboses. The patient recovered with sequelae.
4	(b) (6)	(b) (6) Thrombocytopenia, Cerebral haemorrhage, Cerebrovascular accident, Epistaxis, Headache, Loss of consciousness, Retching, Haemorrhage, Contusion	82-year-old man with history of headache, nausea, back pain, palpitations, cardiac bypass who was taking gabapentin for pain and an unspecified medication for a clotting disorder that led to his cardiac bypass, had his 1st dose of vaccine on 07 Jan 2021. Twenty-eight days later, he had epistaxis, retching and lost consciousness. He was brought to the hospital and found to have a brain bleed. His platelet count was zero. On examination there was evidence of bleeding on areas of his body. He died that day. There was no description of thrombosis in this case. This report was discussed in the submitted SSRM #4 review of Embolic and Thrombotic Events (Appendix 3.2)

Table 2. Remaining Eudravigilance Cases

	EMA Reference	Pfizer AER PTs reported	Pfizer Summary
5	(b) (6)	(b) (6) Thrombocytopenia, Cerebral thrombosis	53-year-old man with no history or medications reported, had dose 1 of the vaccine and the following day was brought to the emergency department for unspecified reasons and found to have thrombocytopenia and “blood clots in the brain.” He underwent mechanical thrombectomy and was then brought to the ICU until he fully recovered. Outcome reported as unknown. There is a lack of information on the patient’s medical history and no labs or imaging studies, making the case difficult to assess. It is not clear if the “clots in the brain” were due to intravascular clotting or due to extravascular blood from vascular bleeding that required evacuation.
6	(b) (6)	(b) (6) Thrombocytopenia, Cerebral thrombosis, Loss of consciousness, Epistaxis, Aphasia	50-year-old man from Canada who was reported to have no risk factors for stroke, received dose 1 of vaccine while in the US and in about 24 hours, had epistaxis and could not talk. He then lost consciousness and was emergently brought to the hospital. He was found to have thrombocytopenia and intracranial bleeding and a thrombectomy was performed. It was reported that 9 blood clots were seen and 3 were removed. He was then able to remove the biggest 3. At the time of the report, he was in the ICU receiving blood thinners. Outcome was unknown. The case lacks detail in regard to history and labs and imaging that would help assessment. It is not clear if intravascular thrombosis was present or if the clotting blood was outside of the cerebral vasculature.
7	(b) (6)	(b) (6) Thrombocytopenia, Deep vein thrombosis	62-year-old woman with a history of pancreatic cancer with metastasis to the liver and spleen (untreated due to impaired liver function), diabetes mellitus, hypertension, obesity, multiple sclerosis, and an unidentified blistering skin disease, was taking furosemide, oxycodone, enalapril, diclofenac, metformin, insulin and omeprazole. She received dose 1 and was reported to have experienced thrombocytopenia 8 days later. Four weeks later, she received dose 2 and 4 days later had bilateral leg pain. She was started on ceftriaxone for an infection on the leg that drained pus and blood. One week after dose 2 multiple leg thromboses were detected bilaterally. She quickly deteriorated, had multiorgan failure and DIC was suspected. The patient died 9 days after dose 3. It was unknown if an autopsy was performed. This unfortunate case describes a woman with metastatic pancreatic cancer and events that are most likely related to the progression of her disease.

Table 2. Remaining Eudravigilance Cases

	EMA Reference	Pfizer AER PTs reported	Pfizer Summary
8	(b) (6)	(b) (6) Haemorrhage, Herpes zoster, Aphasia, Cerebral venous sinus thrombosis, Immune thrombocytopenia, Contusion, Rectal haemorrhage	83-year-old woman with a history that included head injury, hypertension, chronic lymphocytic leukaemia and recent treatment for cancer (radiotherapy or chemotherapy), high cholesterol, low folate, and atrial fibrillation, taking amlodipine, apixaban, atorvastatin, and candesartan. She was reported to have had a platelet count of 129 in Oct 2020. She received dose 1 of vaccine on 08 Jan 2021 and a complicated medical course followed. On 13 Feb 2021, she was found to have a platelet count of 3 (nadir was 1) and diagnosed with ITP. Infectious screen (HIV, HBV, HCV, herpes zoster and CMV) was negative as was an autoimmune screen. She was treated with dexamethasone, IVIG and prednisolone and was reportedly unresponsive to treatment. She began romiplostim and after the 3rd dose, her platelet count was improving however, on 12 Mar 2021 she developed an expressive dysphasia and brain imaging showed a CVST. A thrombophilia screen was negative. Her platelet count was 122 on 19 Mar 2021, but it dropped to 3 on 01 Apr 2021 after missing a dose of romiplostim. The outcome of ITP is recovering, and the rest of the events is unknown. This elderly woman has several medical issues, including cancer and recent treatment for cancer, AF and head injury, complicating assessment of the thrombocytopenia and CVST.
9	(b) (6)	(b) (6) Thrombocytopenia	Upon review of the narrative, this case appears to be a duplicate of AER (b) (6) (b) (6) and will be further investigated.
10	(b) (6)	(b) (6) Hemiparesis, Malaise, Platelet count decreased, Myalgia, Thrombophlebitis, Headache, Fatigue	74-year-old man with a history of alpha-2 antiplasmin deficiency, pulmonary embolism (May 2020) taking hydrochlorothiazide, clopidogrel and candesartan. On 31 Mar 2021, he received dose 1. The following day, his right arm lost strength for about 5 minutes, he had a headache and myalgia and fatigue. On 02 Apr 2021, he was examined to investigate for a TIA. An MRI (brain) was done (no results provided), an unspecified duplex test and heart rhythm test were done (no results provided). His platelet count decreased to 158 (they were 274 on 25 Jan 2021). On 05 April, he was diagnosed with thrombophlebitis of the left leg (no DVT). At the time of the report, he was recovering from fatigue, had not recovered from malaise and headache and had recovered from hemiparesis, decreased platelet count, muscle strain and thrombophlebitis. The patient reported that his hematologist concluded that hematologically there were no impediments to receiving dose 2, however, the patient opted to cancel it. This patient did not have evidence of a deep venous thrombosis and TIA was not confirmed. The platelet count was not reported to be <150

Table 2. Remaining Eudravigilance Cases

	EMA Reference	Pfizer AER PTs reported	Pfizer Summary
11	(b) (6)	(b) (6) Cerebral venous sinus thrombosis, Coagulopathy, Cardio-respiratory arrest, Thrombocytopenia, Neutropenia, Lymphocytosis, Leukocytosis	55-year-old woman with a history of obesity and legionella infection and acute respiratory failure (2009); medications were not reported. She had dose 2 on 07 Jan 2021 and dose 2 on 28 Jan 2021. The following day she developed a headache and began vomiting, she presented to medical attention on 01 Feb and MRI head and angiogram were indicative of a cerebral venous sinus thrombosis (right transverse sinus, distal portion of the left transverse sinus, sigmoid sinus). A head CT showed hyperdensity of the falx cerebri and a hemorrhagic focus in the right parietal area; therapy with enoxaparin was begun; the patient became sleepier with time and a repeat CT of the head was unchanged. Labs: D-dimer (increased) 8038 ug/l; lymphocytes (increased) 16200; neutrophils (decreased) 500; Platelets (decreased) 59,000; WBC (increased) 17,000. Early the next morning, the patient went into cardio-respiratory arrest and died. An autopsy was ordered but it is not known if it was conducted. Cause of death were reported as sinus cerebral thrombosis, coagulopathy, and cardio-respiratory arrest. A product quality investigation for the batch was done and no quality issues were identified. This report was discussed in the submitted SSRM #4 review of Embolic and Thrombotic Events (Appendix 3.2)

Of the 11 cases, AER (b) (6) appears to be a duplicate of AER (b) (6) and will be investigated. Of the 10 remaining cases, 7 do not describe concurrent thrombocytopenia (platelets $<150 \times 10^9/L$) and intravascular venous or arterial thrombosis. Of the 3 reports that do describe the occurrence of intravascular thrombosis and thrombocytopenia:

- AER (b) (6) describes a woman with metastatic pancreatic cancer and possible DIC, which are more likely causes of the thrombosis and thrombocytopenia
- AER (b) (6) describes an elderly woman with a baseline thrombocytopenia, head injury and a malignancy, which put into doubt any role of the vaccine
- AER (b) (6) describes a middle-aged woman who does not have a clear alternative explanation for the development of CVST although her obesity may be a risk for thrombosis. And although her WBC is elevated, the lack of further lab work including an infection work-up, limits the ability to come to a conclusion on the etiology of her medical conditions. This case was reviewed in a previous evaluation of thromboembolic cases (SMSR #4).

This review does not identify a new safety signal for the Pfizer/BNT COVID-19 vaccine.

1. INTRODUCTION

Transverse myelitis (TM) is a neurological disorder causing segmental bilateral acute spinal cord injury as a result of acute inflammation. It is seen in relation to infectious processes, autoimmune process like systemic lupus erythematosus, mixed connective tissue disorder, Sjogren's syndrome, systemic sclerosis, antiphospholipid antibody syndrome, ankylosing spondylitis, rheumatoid arthritis, intoxications (baclofen, penicillin, lead) and multiple sclerosis..¹ Up to 50% of patients presenting with TM have a preceding infection.¹ The most common microbiological agents related to TM include: viral (with enterovirus and coxsackie virus being the most common), mycoplasma, and schistosomiasis. In most cases, symptoms of TM begin after the patient has recovered from the infectious disease and the infectious agents have not been isolated from the nervous system. Thus, microbiologically associated TM does not appear to be a direct infectious process, but rather an autoimmune response that may be triggered by an infectious agent. Idiopathic TM accounts for about 10 to 45% of all cases.¹ Approximately one third of patients recover with little to no sequelae, one third have moderate degree of residual disability, and one third may have severe disabilities.

Estimates of incidence of acute transverse myelitis (TM) are varied, the annual incidence rate ranged from 1.34 per million to 3 per 100,000. Age distribution appear to be bimodal, with peaks between 10-19 and 30-39 years of age. No gender, ethnic, or geographic predispositions have been established.^{1,2}

2. TRANSVERSE MYELITIS AND VACCINATION

A multi-analysis study by Agmon-Levin et al³ on TM temporally related to vaccination reported 37 cases published over 39 years (between 1970 and 2009). In most cases, occurrence was between several days and 3 months following vaccination. The authors conclude that the association between vaccines and autoimmune diseases remains an issue of debate for most vaccines. As not all individuals who suffered from an infection will eventually develop an autoimmune phenomenon, it was suggested that autoimmune diseases develop in those who are genetically susceptible.

Another study analyzed the association of immunization and subsequent development of TM or acute disseminated encephalomyelitis (ADEM) post vaccination.⁴ The authors identified all cases of TM and ADEM in the Vaccine Safety Datalink population (a collaboration between the US Centers for Disease Control and Prevention and several US integrated health systems), then using a case-centered method, compared vaccination of each case to vaccination of all matched persons in the study population, who received the same type of vaccine, with respect to whether or not their vaccination occurred during a predetermined exposure interval. Using this method, a risk difference (excess risk) of TM and ADEM was calculated for each vaccine. The analysis includes nearly 64 million vaccine doses, with the authors concluding that for TM, there was no statistically significant increased risk due to immunization. For ADEM, there was no statistically significant increased risk following any vaccine except for Tdap (adolescent and adult tetanus, reduced diphtheria, acellular pertussis) vaccine.

3. TRANSVERSE MYELITIS AND COVID-19

Coronavirus infections have been associated with neurological manifestations (eg, febrile seizures, convulsions, change in mental status, and encephalitis).^{5,6} Neurotropic and neuroinvasive capabilities of coronaviruses have been described in humans. Upon nasal infection, coronavirus enters the central nervous system through the olfactory bulb, causing inflammation and demyelination.⁶ In addition, most coronaviruses share similar viral structures and infection pathways; hence, the pathomechanisms previously found for other coronaviruses may also be applicable for SARS-CoV-2. A growing body of evidence suggests that neuroinvasion and neurotropism is a common feature of human coronaviruses.⁵ Infection with SARS-CoV-2 has been associated with neurological manifestations, and in a few cases the virus presence and/or antibody presence has been shown in cerebrospinal fluid.⁷⁻⁹ Several case reports describing transverse myelitis in temporal relationship with Coronavirus infection have been published. Most cases reported a time to onset between 8 days to 3 weeks upon infection symptoms. In most cases, SARS-CoV-2 infection was detected only after hospitalization due to the transverse myelitis symptoms.¹⁰⁻¹⁴

In a few cases, the throat swab showed a negative SARS-CoV-2 PCR and positive antibodies (IgM and IgG), while in other cases antibodies could not be detected, while the throat swab SARS-CoV-2 PCR was positive.¹⁰⁻¹⁵ These data suggest that time to onset from infection to development of transverse myelitis may vary. In all published cases no other infective agents have been detected in blood examination nor in the cerebrospinal fluid. In all reported cases lymphocytosis was present in the cerebrospinal fluid while the protein level varied from normal to extremely high in different subjects. Treatments including corticosteroid, immunoglobulin and plasma exchange have resulted in improvement of signs and symptoms.¹⁰⁻¹⁵

Nevertheless, despite an extensive workup, as many as 60% of cases may remain idiopathic, meaning the exact pathophysiology of the disease is unknown and varies based on etiology.¹⁶ When related to an infectious cause, it is often attributed to an autoimmune-mediated response, as opposed to direct invasion and injury of the spinal cord. Currently, no definitive conclusion may be drawn, and the mechanism through which SARS-CoV-2 may be linked to TM is still unclear.

4. METHOD

Pfizer's safety database contains cases of adverse events reported spontaneously to Pfizer, cases reported by the health authorities, cases published in the medical literature, cases from Pfizer-sponsored marketing programs, non-interventional studies, and cases of serious adverse events reported from clinical studies regardless of causality. The Pfizer safety database was searched for all COVID-19 Vaccine cases received through 17 May 2021 using the MedDRA version 23.1 using the search criteria: MedDRA High Level Terms 24:0. Myelitis including infective.

The limitations of post-marketing adverse drug event reporting should be considered when interpreting these data:

- Reports are submitted voluntarily, and the magnitude of underreporting is unknown. Some of the factors that may influence whether an event is reported include: length of time since marketing, market share of the drug, publicity about a drug or an adverse event, seriousness of the reaction, regulatory actions, awareness by health professionals and consumers of adverse drug event reporting, and litigation.
- Because many external factors influence whether or not an adverse event is reported, the spontaneous reporting system yields reporting proportions not incidence rates. As a result, it is generally not appropriate to make between-drug comparisons using these proportions; the spontaneous reporting system should be used for signal detection rather than hypothesis testing.
- In some reports, clinical information (such as medical history, validation of diagnosis, time from drug use to onset of illness, dose, and use of concomitant drugs) is missing or incomplete, and follow-up information may not be available.
- An accumulation of adverse event reports does not necessarily indicate that a particular adverse event was caused by the drug; rather, the event may be due to an underlying disease or some other factor(s) such as past medical history or concomitant medication.

The Brighton Collaboration criteria¹⁷ will be used for diagnostic criteria of certainty as described below:

Level 1 of diagnostic certainty: Myelitis

a) Demonstration of acute spinal cord inflammation (\pm meninges) by histopathology.

Level 2 of diagnostic certainty: Myelitis

(a) Myelopathy (development of sensory, motor, or autonomic dysfunction attributable to the spinal cord, including upper- and/or lower-motor neuron weakness, sensory level, bowel and/or bladder dysfunction, erectile dysfunction).

AND

(b) **TWO OR MORE** of the following indicators suggestive of spinal cord inflammation:

1. Fever (temperature ≥ 38 °C),
2. CSF pleocytosis (>5 WBC/mm³ in children >2 months of age; >15 WBC/mm³ in children <2 months of age),
3. Neuroimaging findings demonstrating acute inflammation (\pm meninges), or demyelination of the spinal cord.

Level 3 of diagnostic certainty: Myelitis

090177e19749cf15\Approved\Approved On: 14-Jun-2021 14:01 (GMT)

(a) Myelopathy (development of sensory, motor, or autonomic dysfunction attributable to the spinal cord, including upper- and/or lower-motor neuron weakness, sensory level, bowel and/or bladder dysfunction, erectile dysfunction).

AND

(b) **ONE** of the following indicators suggestive of spinal cord inflammation:

4. Fever (temperature $\geq 38^{\circ}\text{C}$),
5. CSF pleocytosis (>5 WBC/ mm^3 in children >2 months of age; >15 WBC/ mm^3 in children <2 months of age),
6. Neuroimaging findings demonstrating acute inflammation (\pm meninges), or demyelination of the spinal cord.

5. RESULTS

A total of 67 cases were identified using the search criteria mentioned above as of 17 May 2021. There were 51 females, 15 males, and in one case gender was not reported. The group included people aged 21 to 84 years (mean 48, median 43). The age distribution was: 53 (79.1%) adults (age ≥ 18 to <65), 11 (16.4%) elderly (age ≥ 65), and 3 (4.5%) where the age was not reported. Most of the cases were reported from UK (23, 34.3%), followed by United States (20, 29.9%). The outcome of the event was reported as not recovered at time of reporting in 30 cases (44.8%) resolving/recovering in 25 (37.3%) and unknown in 15 cases (17.9%). All cases were assessed as serious. All cases have been assessed according to BC criteria as follows:

- 0 cases (0%) met level 1
- 2 cases (3%) met level 2
- 5 cases (7.5%) met level 3
- 53 cases (79.1%) met level 4
- 7 cases (10.4%) met level 5

Six cases reported TM in the context of ongoing cancer and were suggestive of a paraneoplastic process. In 5 cases the TM was reported in subjects with underlying TM, optic neuritis or confounded with therapy used (eg, adalimumab). In additional 6 cases the diagnostic examination (MRI and/or Cerebrospinal fluid) did not support the diagnosis of TM. In 9 cases the examination and/or medical history supported the alternate diagnosis of multiple sclerosis.

The remaining 41 cases, one case is reported 3 times and 1 case report of a single subject reporting TM after the first dose and worsening after the 2nd dose. Overall, there are 38 unique cases remaining. Among them 20 cases were reported after vaccination dose 1, 6 after dose 2, and for 12 the dose number was not reported.

Of these 38 cases the BC was assessed as follows:

Of these 38 cases the BC was assessed as follows:

BC 1: 0

BC 2: 2

BC 3: 2

BC 4: 33

BC 5: 1

Time to onset was reported for 34 cases and ranged from the same vaccination day to 21 days after vaccination (mean: 6.5; median: 5). Details are reported in Table 1.

Table 1. Time to Onset After Vaccination

Time (days) to Onset	Number of Cases
0-1	7
2-4	9
5-7	5
8-15	11
16-21	3
0-1	7
Total	35

Cases meeting BC 1 according to the Brighton collaboration criteria:

There were no cases that provided information for definitive TM per Brighton collaboration criteria.

Cases meeting BC 2 and 3 according to the Brighton collaboration criteria:

(b) (6) (BC 2): 60-year-old male patient received COVID-19 Vaccine on 29 January 2021. The patient's medical history included acute prostatitis and dysuria with prostate-specific antigen and a recent infection and intravenous (IV) antibiotic therapy was reported. He was hospitalized on 04 February 2021 for paresthesia and subacute onset of gait impairment. Clinical examination showed the following: proprioceptive-looking ataxia with widening of the support polygon, proprioceptive damage to the 4 limbs, hypopallesthesia of the bilateral lower limbs reaching up to the knees, anesthesia of the perineum. No motor deficit. Lumbar puncture: inflammatory fluid predominantly lymphocytic, reactive in appearance. Proteinorachia at 0.51 g /L. Spinal cord MRI: Posterior cervical myelitis over approximately 6 cm at the level of the C2-C3-C4 vertebrae without contrast enhancement. Cerebral MRI: possible old ischemic sequela. Complete infectious and immunological

assessments without particularities. Diagnosis: acute posterior cervical myelitis, probably post-infectious, with no etiological agent found. Probabilistic anti-infective treatment with acyclovir, doxycycline, cymevan was initiated as well as corticosteroid therapy. The clinical course was satisfactory with progressive neurological recovery.

(b) (6) (BC 3): A 69-year-old female patient received COVID-19 Vaccine on 20 January 2021. The patient's medical history included hyperlipidemia, hypothyroid, restless legs. Two days after vaccination the patient developed weakness of legs then arms. MRI cervical and thoracic spine on January 2021 most consistent with TM. The patient was recovering. IV steroids and physical therapy were received as treatment. The outcome of the events was reported as recovering.

(b) (6) (BC 2): A 37-year-old female patient received the first dose of COVID-19 Vaccine on 26 January 2021. The patient's medical history included type 2 diabetes mellitus, type 1 diabetes, hypothyroidism, hyperglycemia, diabetes under multiple concomitant medications. The patient previously received influenza vaccine (unknown manufacturer) in December 2020 for immunization. Three days after Covid-19 vaccination the subject reported paresthesia all over the body with some reduction in sensation/reduced sensation bilaterally below T3. Five days later she was hospitalized and underwent magnetic resonance imaging (MRI), lumbar puncture and several other tests and was diagnosed with transverse myelitis (C3 lesion and increased cells and oligoclonal band positive in cerebrospinal fluid). She was treated with steroids by IV drip and oral. The patient outcome of the events was not recovered. No results of infectious or other etiologic work-up was provided.

(b) (6) (BC 3): A 75-year-old female received the first dose of COVID-19 Vaccine on 23 January 2021. The patient's concurrent conditions included hypertension, hyperlipidemia, GERD, blood glucose elevated, degenerative disc disease, history of nonmelanoma skin cancer, irritable bowel syndrome, keratoconus of both eyes, corneal transplant, deep vein thrombosis pulmonary embolism in 2019, left leg weakness, myelitis, osteoarthritis, osteopenia, pulmonary emboli, sensory impairment, spinal stenosis, vaccination complication, vitamin D deficiency and pregnancy; surgical history included: total vaginal hysterectomy, bilateral ureteral stent placements, lumbar decompression under multiple concomitant medication. One day post vaccination the subject reported numbness of the left lower leg and was diagnosed with TM, and started on IV steroids for 5 days. Lumbar puncture high number of cells and thoracic MRI shows T2 hyperintensity in dorsal lateral cord. No results of infectious or other etiologic work-up was provided. She was sent into a rehabilitation clinic and was recovering from the TM event.

6. OBSERVED VERSUS EXPECTED ANALYSES

The MAH conducted unadjusted observed to expected ratio (O/E) analyses for the 67 reported TM cases. The O/E ratio was above 1 for the 21-day risk window and below 1 for the no risk window, indicating there may be an increased risk of TM among recipients of the BNT162b2 vaccine.

090177e19749cf15\Approved\Approved On: 14-Jun-2021 14:01 (GMT)

Table 2. Observed versus Expected (O/E) Analysis of 67 Spontaneously Reported Transverse Myelitis Cases through 10 May 2021

	21-Day Risk Window (12,398,436 PY^a)	No Risk Window (34,796,539 PY)
O/E ratio (95% CI)	1.544 (1.197, 1.961)	0.550 (0.426, 0.699)
Expected cases ^b	43	122

a. PY through 09 May 2021

b. Derived from 0.35 per 100,000 PY background rate

Expected case counts were derived using a background incidence rate of 0.35 per 100,000 person years¹⁸ This rate was calculated from the background rates provided by the ACCESS/VAC4EU initiative. The incidence rates (narrow case definition) from 2017-2019 were averaged within each of the ten data sources where available. From these, a single average rate was selected based on the range of observed values, type of care typically sought for the AESI (e.g. hospital or general practitioner), and relevant characteristics of the databases, as described in the ACCESS User Guide.¹⁹ The ACCESS background rate is derived from medical records coded as transverse myelitis or acute transverse myelitis.²⁰ Observed cases were identified in the spontaneous reporting system using the PT codes acute flaccid myelitis, bulbar poliomyelitis, myelitis, myelitis transverse, noninfectious myelitis, paraneoplastic myelopathy, poliomyelitis, post-polio syndrome, spinal cord infection, vaccine associated paralytic poliomyelitis, and viral myelitis, which is broader than the definition used by ACCESS. Person years of exposure estimates were derived from publicly available information reported by countries where COVID-19 Vaccine is authorized.²¹ For periods when more than one vaccine brand was authorized for use in each country, the doses administered were assumed to be divided equally by the number of brands of vaccines authorized. The estimate of administered doses does not reflect exposure in persons vaccinated in countries that did not publicly report.

O/E ratios were calculated using a 21-day risk window and no risk window. However, the 21-day risk window was not applied to the observed case count; all 67 cases were included in the numerator regardless of the duration between vaccination and event onset date.

Several limitations of the observed to expected comparison must be noted. With respect to observed cases, case ascertainment through the spontaneous reports likely reflect an underreporting due to incomplete reporting or a lag in reporting. Additionally, spontaneous surveillance systems are prone to reporting bias whereby events that have been previously identified as potentially related to the vaccine are more likely to be reported despite not meeting the clinical definition. Conversely, events that have not been previously associated with a vaccine are likely to be underreported.

With respect to the expected case counts, estimates concerning both exposure to vaccine and the background rate have limitations. Our exposure estimate assumes that the number of reported administrations is complete and accurate when in fact not all countries administering vaccine have reported counts of vaccine administration to the data source. Thus, the exposure is underestimated.

The expected count also assumes that the expected incidence rate in the vaccinated population is the same as that in the population used to calculate the background rate. However, it is possible that the delivery of health care, population demographics, and underlying health status of the population used for the background rate estimate differ from those expected in the vaccinated population. To date, the United States contributes the most exposure data.

A final limitation concerns the risk window, the period during which one is expected to be at risk of a given event if there is a causal association between the event and the vaccine. Two periods, 21 days and no risk window, were selected to provide an estimate assuming a more acute onset (21-day window) and a more latent onset (no risk window). The 21-day risk window is particularly conservative as all observed cases are included in the numerator of the O/E ratio regardless of the days since vaccination dose, which will lead to an overestimation of the ratio if observed cases occurred outside of the risk window.

7. SUMMARY AND CONCLUSION

Most cases were assessed as BC level 4 (79.1%) and were reporting insufficient information for a proper evaluation. In addition, 26 cases (39%) were reported in the context of ongoing cancer or in subjects with underlying TM, or diagnostic examination (MRI and/or cerebrospinal fluid) did not support the diagnosis of TM or supported instead a pre-existing multiple sclerosis diagnosis.

Four cases without these confounding factors and meeting BC level 2-3 were identified, of them one was an elderly frail subjects with multiple underlying comorbidities, another case reported infections few days before the onset of TM, and the 2 remaining cases were reported in an adult and an elderly subject with underlying autoimmune linked disease (diabetes and hypothyroidism respectively) that 2 and 3 days after the first vaccine dose reported the symptomatology.

The E/O analysis showed a small increase over the 21 days risk window nevertheless, as described in the O/E analysis the 21-day risk window is particularly conservative as all observed cases are included in the numerator of the O/E ratio regardless of the days since vaccination dose, which will lead to an overestimation of the ratio if observed cases occurred outside of the risk window. In addition, the ACCESS background rate used to calculate the expected number of cases is derived from medical records coded as transverse myelitis or acute transverse myelitis while the observed cases were identified in the spontaneous reporting system using a broader search criteria (as specified in the method). The upper limit of the 95% confidence interval for the observed to expected ratio without a risk window did not exceed 1.

Overall, given the totality of the available information, changes in the risk minimization measures or updates to the product information label are not warranted at this time. The benefit risk profile of the vaccine remains favorable. The topic will continue to be closely monitored.

APPENDIX 3.7 SAFETY EVALUATION OF DIZZINESS

Pfizer-BioNTech COVID-19 Vaccine

Dizziness

Report Prepared by:

BioNTech-Pfizer

The information contained in this document is proprietary and confidential. Any disclosure, reproduction, distribution, or other dissemination of this information outside of BioNTech and Pfizer, its Affiliates, its Licensees, or Regulatory Agencies is strictly prohibited. Except as may be otherwise agreed to in writing, by accepting or reviewing these materials, you agree to hold such information in confidence and not to disclose it to others (except where required by applicable law), nor to use it for unauthorized purposes.

1. INTRODUCTION

Dizziness is a common yet imprecise symptom often encountered by physicians. Primary care physicians see at least one-half of the patients who present with dizziness. The differential diagnosis is broad, with each of the common etiologies accounting for no more than 10% of cases. Because the symptoms are vague, physicians must distinguish benign from serious causes that require urgent evaluation and treatment. (1)

Dizziness has been reportedly in association with other vaccines, including the influenza vaccine. (2)

2. METHODOLOGY

Pfizer's safety database contains adverse events reported spontaneously to Pfizer, cases reported by the health authorities, cases published in the medical literature, cases from Pfizer-sponsored marketing programs, non-interventional studies, and cases of serious adverse events reported from clinical studies regardless of causality.

The limitations of post-marketing adverse drug event reporting should be considered when interpreting these data:

- Reports are submitted voluntarily, and the magnitude of underreporting is unknown. Some of the factors that may influence whether an event is reported include: length of time since marketing, market share of the drug, publicity about a drug or an adverse event, seriousness of the reaction, regulatory actions, awareness by health professionals and consumers of adverse drug event reporting, and litigation.
- Because many external factors influence whether or not an adverse event is reported, the spontaneous reporting system yields reporting proportions not incidence rates. As a result, it is generally not appropriate to make between-drug comparisons using these proportions; the spontaneous reporting system should be used for signal detection rather than hypothesis testing.
- In some reports, clinical information (such as medical history, validation of diagnosis, time from drug use to onset of illness, dose, and use of concomitant drugs) is missing or incomplete, and follow-up information may not be available.
- An accumulation of adverse event reports does not necessarily indicate that a particular adverse event was caused by the drug; rather, the event may be due to an underlying disease or some other factor(s) such as past medical history or concomitant medication..

The Pfizer safety database was searched for all BNT162b2 vaccine reports received cumulatively through 30 April 2021 using the following MedDRA version 24.0 search criteria: PT Dizziness. The data was analyzed in two cohorts, Dizziness occurring within the first 24 hours (Latency of Day 0) versus those with a latency of 1-2 days post vaccination with attention to co-reported systemic reactogenicity symptoms during this time frame. Dizziness reported during the placebo-controlled stage of Phase 2/3 clinical study C4591001 was also reviewed.

3. RESULTS

3.1. Unblinded clinical study data

Of subjects reporting at least 1 adverse event from dose 1 to 1 month after dose 2 in the blinded placebo-controlled follow-up period of Phase 2/3 clinical study C4591001 (data-lock date 13 Mar 2021), 78 (0.4%) of 21,926 participants in the active cohort reported dizziness, compared to 60 (0.3%) of 21,921 participants in the placebo cohort. Postural dizziness was reported by 2 (0.0%) BNT162b2 recipients and 1 (0.0%) placebo recipient.

3.2. Post-authorization data

The search identified 15250 cases, of them 11800 reported a latency ranging from Day 0 until Day 10, *please refer to Table 1 for description*. There were 12149 (79.7%) females, 2746 males (18%), and gender was not reported in 355 cases.

Most cases were reported from the United Kingdom (3803) followed by Mexico (3514), and the United States (3380). The most frequent reported age was between 31-50 years old with a mean of 46.3 and median of 46.0. Age distribution is reported below in Table 2.

Table 1: Dizziness events: Number of events with latency of Day 0 to Day 10 (11800)

Latency	0	1	2	3	4	5	6	7	8	9	10	Grand Total
Case count	6100	3753	818	395	259	144	99	92	52	44	44	11800

Table 2 Dizziness - Age distribution of total (15250) cases

Age	Count	%
Less than or equal to 17 years	38	0.20%
18 - 30 years	2669	17.50%
31 - 50 years	6243	40.90%
51 - 64 years	2861	18.80%
65 - 74 years	1185	7.80%
Greater than or equal to 75 years	1075	7.00%
Unknown	1179	7.70%

3.2.1. Dizziness – Latency Day 0

Dizziness events occurring with the first 24 hours post vaccination were a total of 6100 (Approximately 40 %) of the total cases. Co-reported events were most commonly reactogenicity events. The most common were headache (2718), nausea (2097), asthenia (1216), and chills (1130). Of note, pointing to a status of anxiety and stress condition, tachycardia was reported in 772 cases (approximately 11%) of Dizziness. There were 4 cases with a fatal outcome, *please refer to Table 4 for description of all events with fatal outcome*. The age of the patients was between 80-94 years old. Three of the patients had a medical history of neurological and cardiac manifestations. No autopsy reports were provided.

Out of the 6100 reports that included dizziness occurring on the day of vaccination, 4 cases were co-reported with impaired ability to drive:

(b) (6) : 35-year-old male from the US received first dose on 19 December 2020, history included ongoing exercised induced tachycardia. The patient has no known allergies. The patient experienced lightheaded, mild confusion, rapid breathing and difficulty driving on 19Dec2020, started 5-10 minutes after injection that lasted approximately an hour. Event was assessed as serious medically significant. Recovered after one hour.

(b) (6) : 39-year-old female from the UK received first dose on 04 January 2021. On 25 January 2021 after her second injection, the patient experienced her lips started tingling and getting numb. One hour and 30 minutes after the injection, her throat started swelling, had a hard time drinking water with. On the same day she experienced generalized prickle sensation occurred and prickle tingling sensation of upper and lower lip vermillion. She also had dizzy spells for 3 days after vaccination. She presented with severe dizziness and reported she could not walk or drive. The patient recovered on 25Jan2021. No hospitalization was involved.

(b) (6) : 39-year-old female from the UK received first dose on 13 Feb 2021. It was reported that on 13Feb2021, after 5 minutes the patient had tingling in arm and hand, then tingling in lips, then left arm. The patient was also dizzy when she stood up so she was taken to the room to lie down. She couldn't drive home. Rest of the day and most of following, she was extremely tired, felt weird and weak.

(b) (6) : 40-year-old female from Ireland, received her vaccination on 04 Jan 2021. The patient experienced dizziness, lethargy, disturbance in attention/ inability to concentrate, dysarthria/slurred speech, feeling drunk and feeling abnormal/ brain feeling foggy following vaccination on 04Jan2021 (one-hour post vaccination) As of 29 Jan 2021, the patient outlined that the neurological symptoms she experienced previously (dizziness, inability to concentrate, slurred speech, foggy feeling in head and feeling drunk) had improved on an unspecified date. However, on an unspecified date, she experienced headaches, neck and shoulder pain (on the side of injection site), also felt more tired than usual/tiredness. The patient had to take a week off work and did not feel confident driving either. The outcome of the events was recovered on an unspecified date.

3.2.2. Dizziness – Latency Day 1-2

Dizziness events occurring within 1-2 days post vaccination were a total of 4570 (30%) of the total 15250 reports of dizziness. Reactogenicity events were also commonly co-reported with these cases. The most common co-reported systemic reactogenicity symptoms were headache (2092), nausea (1694), asthenia (1216), and fatigue (1282). Out of these 4570 cases, the majority of cases with reported outcome were recovered/resolved (1798).

Out of 4570 reports that included dizziness occurring on the day of vaccination, 7 cases were co-reported with impaired ability to drive.

(b) (6) : A 54-year-old female from the UK received the vaccine (unspecified if dose 1 or dose 2) on the evening of 02 Feb 2021 and reported feeling very dizzy the following day to the extent that she had to hold onto something to steady herself. She was not able to drive that day due to the dizziness. She did not provide information on other symptoms she may have been experiencing. She reported she was much better Day 2 and 3 after vaccination with a couple of dizzy spells. She was recovering from dizziness at the time of the report.

(b) (6) : A 54-year-old female patient from the US. On Wednesday, 10 Feb 2021, she received her second injection. At night, she experienced severe headache and chills. She fainted the next morning and fell down a flight of stairs that resulted in a fracture of the right thumb in addition to experiencing a separated shoulder bone, a whiplash and a concussion. She continues to experience dizziness. She cannot complete household tasks, still cannot drive and can't go to work and has been off work since then.

(b) (6) : 46-year-old male from UK. Received his second dose on 01 Mar 2021. On the same day, he experienced dizziness, vertigo. The subsequent day, the patient experienced nausea and he was unable to safely drive home from work. The symptoms resolved the subsequent day. . The event was assessed as serious/Medically significant.

(b) (6) : Male patient from the US, age unknown. Received the vaccine on 08Apr2021, Three days later he became dizzy, and complained of vertigo and tinnitus, He could not drive.

(b) (6) : 49-year-old female from the UK. Received the vaccine on 12 Jan 2021. Experienced dizziness a day later on 13 Jan 2021. She was unable to drive on an unspecified date. She recovered from dizziness on 15 Jan 2021.

(b) (6) : 45-year-old female from the US. She received her vaccine on 30 Dec 2020. On the same day she experienced dizziness with visual disturbances, which increased going forward until. 20Jan2021. It was impairing her from driving on an unspecified date. She was hesitant to get her second injection. The complications were impairing her ability to drive and was considered as serious (disability).

(b) (6) : 34-year-old female from Ireland. Received her vaccine on 15 Jan 2021. She experienced anaphylactic shock, vomiting, nausea, and inability drive. She continued to have headache for 4 days. She recovered on an unspecified date.

Table 4: Dizziness events with fatal outcome

There were 8 events of Dizziness with a fatal outcome, 4 of them occurred in the first 24 hours after vaccination and 1 occurring on Day 2, with the rest occurring at other periods, for a full description please refer to Table 4.

Dizziness events had a fatal outcome with Latency of Day 0

(b) (6) : Male patient from the UK at an unspecified age received the injection on 17 December 2020. On the same day, the patient experienced nosebleed, headache, vomiting blood and dizziness. On 20 December 2020 the patient died. No autopsy report was provided.

(b) (6) : 80-year-old male from the US. Has a medical history of COPD and Afib. Received his vaccine on 20 January 2021. On the same day he experienced dizziness, headache, nausea. He died on the same day. No autopsy report was provided.

(b) (6) : 95-year-old female from Norway. Has a medical history of dementia and cardiac failure. She received the vaccine on 7 January 2021. She experienced syncope on the same day, laboured breathing, weakness in lower extremities and nausea. She died on 20 January 2021. No autopsy report was provided

(b) (6) : 94-year-old male from France. Medical history includes Alzheimer's disease and osteoporosis. The patient received the vaccine on 9 February 2021. After experiencing dizziness, emesis/vomiting, the patient died on 10 February. No autopsy report was provided

There was one case with fatal outcome with latency of Day 2.

(b) (6) : A 27-year old male from the UK. No medical history reported. Received vaccine on 19 December 2021. Experienced dizziness and vomiting blood 2 days after vaccination. He was pronounced dead on 21 December 2021. No autopsy reports were provided.

Table 4: Dizziness with Fatal outcome

AER Number	Age (years)	Gender	Medical History	Conmed	Events Reported	Country
(b) (6)		MALE	Asthma / Vitamin D deficiency	COLECALCIFEROL / SALBUTAMOL SULFATE	Death, Epistaxis, Headache, Dizziness, Haemoptysis, Haematemesis, Latency: Day 0	UNITED KINGDOM
(b) (6)	27.00	MALE			Haematemesis, Loss of consciousness, Dizziness, Pyrexia, Latency Day 2	UNITED KINGDOM

(b) (6)	63.00	MALE	Angioplasty / Anticoagulant therapy / Bone marrow transplant / Cardiac disorder / Leukaemia / Liver disorder / Myocardial infarction / Osteonecrosis / Stent placement		Acute myocardial infarction, Cardiac arrest, Dizziness, Fall. Latency Day 9	GREECE
(b) (6)	80.00	MALE	Arteriosclerosis / Atrial fibrillation / Chronic obstructive pulmonary disease / Renal disorder		Arteriosclerosis, Cardiovascular disorder, Dizziness, Nausea, Headache. Latency Day 0	UNITED STATES
(b) (6)	91.00	MALE	Atrial fibrillation / Cardiac failure chronic / Chronic respiratory failure / Deep vein thrombosis / Dependence on oxygen therapy / Fall / Hypertension / Implantable defibrillator insertion / Intermittent claudication / Living in residential institution / Non- tobacco user / Pleural effusion / Polymyalgia rheumatica / Prostate cancer / Walking aid user	APIXABAN / BUMETANIDE / MORPHINE / TRAMADOL	Cardiac failure, Hallucination, Oedema peripheral, Confusional state, Dizziness. Latency Day 9	NORWAY

---------	-------	------	---	--	--	--------

4. SUMMARY AND CONCLUSION

The greatest number of post-vaccination spontaneous reports of dizziness was 6100 (40%) in the first 24 hours post-vaccination (Day 0-2). Because dizziness is a term commonly used by patients to describe symptoms that are inconsistently defined, and based on the post-authorization reports, it is plausible that the dizziness experienced soon after vaccination is a potential manifestation of vaccination-related situational stress, anxiety and/or is confounded by the systemic reactogenicity experienced in the same time period. Cases of dizziness that described an inability to drive were relatively rare (11). Additionally, in the course of the Phase 2/3 clinical trials, events of dizziness were not meaningfully different in the active cohort (0.4%) compared to placebo cohort (0.3%).

Taken together, the language proposed by Pfizer/BioNtech to better characterize vaccine stress-related responses in the CDS and local labels, by the inclusion of dizziness as one of the potential stress responses, is appropriate at this time.

APPENDIX 3.8 SAFETY EVALUATION OF GUILLAIN-BARRE' SYNDROME

INTRODUCTION

The topic of Guillain Barré syndrome was reviewed because in the French ANSM 14th PV report on AEs reported with the Pfizer-BioNTech Comirnaty vaccine it was considered a potential signal. The review is to include data from spontaneous reports as well as an observed/expected analysis.

1. METHODOLOGY

The Pfizer safety database was searched for all BNT162b2 vaccine cases received through 10 May 2021 using the MedDRA version 24 using the search criteria: SMQ: Guillain-Barré Syndrome, narrow search. The resulting reports were individually reviewed and assessed according to Brighton Collaboration (BC) case definition and level of diagnostic certainty. BC level 1-3 of diagnostic certainty are defined as Guillain-Barré Syndrome or Fisher Syndrome with different level of diagnostic certainty (Sejvar et al 2011). Level 1 provides highest level of diagnostic certainty, whereas the diagnostic certainty is lowest for level 3. Level 4 is defined as "reported event of GBS or FS, with insufficient evidence to meet the case definition" and level 5 as not a case of GBS or FS".

2. RESULTS

A total of 147 cases were identified using the search criteria described above. There were 76 female, 67 males and in 4 cases gender was not reported. The age range between 18 to 97 years of age (59.3 mean). The age distribution was as follows: 80 (54.5%) adults (age ≥18 to <65), 53 (36 %) elderly (age ≥65), and for 14 (9.5 %) cases the age was not reported. Most of the cases were reported from US (36, 24.5%), United Kingdom (30, 20.4%) followed by Japan (12, 8.2%), (see Table 1).

Table 1. Top 10 Countries Reporting GBS

UNITED STATES	36	24.5 %
UNITED KINGDOM	30	20.4 %
JAPAN	12	8.2 %
MEXICO	10	6.8 %
ITALY	9	6.1 %
FRANCE	8	5.4 %
SPAIN	8	5.4 %
GREECE	7	4.8 %
ISRAEL	6	4.1 %
GERMANY	4	2.7 %

The outcome of the event was reported as not recovered at time of reporting in 53 cases (36.1%), as recovering/resolving in 53 cases (36.0 %), and as unknown in 36 cases (24.5%) and fatal in 5 cases (3.4%) (summary reported below).

Time to onset was reported for 117 cases and ranged from 4 hours after vaccination to 63 days after vaccination (see Table 2).

Table 2. Time to Onset

Days after vaccination	Number of cases
Same vaccination day	13
1-3 days	22
4-7 days	27
8-15	24
16-42	27
>42	4
Total	117

A total of 79 cases reported the event after the 1st vaccine doses, 32 after the 2nd dose and the vaccination dose was not reported for 36 cases.

Among the 79 that reported the event after the 1st dose 67 reported the time to onset (see Table 3).

Table 3. Time to Onset After Vaccination Dose 1

Days after 1 st vaccination	Number of cases
Same vaccination day	6
1-3 days	14
4-7 days	11
8-15	16
16-42	17
>42	3
Total	67

Among the 32 cases that reported the event after the 2nd dose 29 reported the time to onset (see Table 4).

Table 4. Time to Onset After Vaccination Dose 2

Days after 2 nd vaccination	Number of cases
Same vaccination day	6
1-3 days	4

4-7 days	9
8-15	5
16-42	5
>42	0
Total	29

Please note that the sum up of the time to onset from the table above is not as the cumulative one as some cases did report the time to onset but did not report the vaccination dose.

The time to onset analysis given the vaccination dose does not evidence any signal.

All cases have been assessed according to BC criteria as follows:

- 4 case (2.7 %) met level 1
- 16 cases (10.8 %) met level 2
- 1 case (0.7 %) met level 3
- 116 cases (79 %) met level 4
- 9 cases (6.1 %) met level 5
- 1 case (0.7%) was referring to another vaccine

The medical history analysis found confounding factors for some cases, as detailed below:

- 2 cases ((b) (6) , (b) (6) meeting BC 4 and 5) reported GBS in the context of cerebrovascular accident
- 4 cases ((b) (6) , (b) (6) , (b) (6) , (b) (6) , assessed as BC level 5 as the symptomatology was long pre-existing) had Chronic inflammatory demyelinating polyradiculoneuropathy. Additional 14 cases (assessed as BC 4: 12, BC 5: 1, BC2: 1) had in the medical history confounding factors as autoimmune disease, HIV, and cancer.
- 9 cases (BC: 4) reported GBS associated or preceded by infection (respiratory or gastrointestinal).
- 3 cases ((b) (6) , (b) (6) , (b) (6)) reported GBS in the context of Covid-19 infection
- 1 case ((b) (6) , BC 1) symptoms were pre-existing the vaccination.

Analysis of cases meeting Brighton collaboration level 1 and 2

Case meeting BC Level 1

Four cases reported GBS assessed as level 1 of Brighton collaboration (BC) as reported both clinical and diagnostic examination (Electroneurography/electromyography and cerebrospinal fluid analysis) compatible with GBS diagnosis. Time to onset varied between 4 to 22 days after vaccination. Of these 4 cases, 1 had signs of demyelination also in the brain suggesting possibly a pre-existing demyelinating pathology. Case details are presented in Appendix 1.

Cases meeting BC Level 2

A total of 16 cases were assessed as BC level 2 as reporting, aside of the clinical examination, either Electroneurography/electromyography or cerebrospinal fluid analysis compatible with GBS diagnosis. Time to onset (TTO) ranged between the same vaccination day to 54 days after vaccination (4 cases reported (TTO) between 0-2 days; 4 cases between 9-14 days; 5 cases between 16-21 days and 1 case 54 days after vaccination). A total of 10 cases reported the vaccination doses and among them 8 cases reported the event after vaccination dose 1 and 2 after dose 2.

Cases reporting the symptoms starting from the same vaccination day to 1-2 days after vaccination reported a time to onset that, even though plausible does not have a biological plausibility to trigger the reported demyelination.

Two cases ((b) (6)) and ((b) (6)) were preceded by a gastrointestinal infection and reported GBS respectively 16- and 18-days post vaccination. One case ((b) (6)) was reported GBS 21 days after vaccination in the context of brain infarct (CT angiography showed dural AV fistula with occluded left transverse sinus, a CT Head left insular/ext capsule infarct). One case ((b) (6)) had the symptoms pre-existing the vaccination and reported a worsening of the same.

Case details are presented in Appendix 2.

Cases reporting a fatal outcome

Five cases reported a fatal outcome after reporting GBS after vaccination, all cases were assessed as BC level 4. All cases were reported in elderly frail subjects where a case ((b) (6)) reported a long time to onset not suggestive of a temporal correlation with vaccination; another case ((b) (6)) report a time to onset of 1 day post vaccination which is unplausible from the mechanistic point of view; another case ((b) (6)) with a medical history of immunodeficiency and pancytopenia reported death 2 months after vaccination with unclear start of the GBS. One case did not report clear time correlation (no vaccination date reported) and last case reported symptoms of weakness and numbness immediately after vaccination, was able to get the 2nd vaccination and was not hospitalized.

All case details are reported in Appendix 3.

3. OBSERVED VERSUS EXPECTED ANALYSIS

The MAH conducted unadjusted observed to expected ratio (O/E) analyses for the 147 reported GBS cases. The O/E ratio was below 1 for both the 21-day risk window and no risk window, indicating there was not an increased risk of GBS among recipients of the BNT162b2 vaccine.

Table 5. Observed versus Expected (O/E) Analysis of 147 Spontaneously Reported Guillain-Barré Syndrome Cases through 10 May 2021

	21-Day Risk Window (12,398,436 PY^a)	No Risk Window (34,796,539 PY)
O/E ratio (95% CI)	0.631 (0.533, 0.741)	0.225 (0.190, 0.264)
Expected cases ^b	233	654

a. PY through 09 May 2021

b. Derived from 1.88 per 100,000 PY background rate

Expected case counts were derived using a background incidence rate of 1.88 per 100,000-person years.¹ Person years of exposure estimates were derived from publicly available information reported by countries where the BNT162b2 vaccine is authorized.² For periods when more than one vaccine brand was authorized for use in each country, the doses administered were assumed to be divided equally by the number of brands of vaccines authorized. The estimate of administered doses does not reflect exposure in persons vaccinated in countries that did not publicly report.

O/E ratios were calculated using a 21-day risk window and no risk window. However, the 21-day risk window was not applied to the observed case count; all 147 cases were included in the numerator regardless of the duration between vaccination and event onset date.

Several limitations of the observed to expected comparison must be noted. With respect to observed cases, case ascertainment through the spontaneous reports likely reflect an underreporting due to incomplete reporting or a lag in reporting. Additionally, spontaneous surveillance systems are prone to reporting bias whereby events that have been previously identified as potentially related to the vaccine are more likely to be reported despite not meeting the clinical definition. Conversely, events that have not been previously associated with a vaccine are likely to be underreported.

With respect to the expected case counts, estimates concerning both exposure to vaccine and the background rate have limitations. Our exposure estimate assumes that the number of reported administrations is complete and accurate when in fact not all countries administering vaccine have reported counts of vaccine administration to the data source. Thus, the exposure is underestimated.

The expected count also assumes that the expected incidence rate in the vaccinated population is the same as that in the population used to calculate the background rate. However, it is possible that the delivery of health care, population demographics, and underlying health status of the population used for the background rate estimate differ from those expected in the vaccinated population. To date, the United States contributes the most exposure data.

A final limitation concerns the risk window, the period during which one is expected to be at risk of a given event if there is a causal association between the event and the vaccine. Two periods, 21 days and no risk window, were selected to provide an estimate assuming a more

acute onset (21-day window) and a more latent onset (no risk window). The 21-day risk window is particularly conservative as all observed cases are included in the numerator of the O/E ratio regardless of the days since vaccination dose, which will lead to an overestimation of the ratio if observed cases occurred outside of the risk window.

4. SUMMARY AND CONCLUSION

Most reported cases (79%) met level 4 of BC. Most cases meeting BC level 1 or 2 were confounded by preceding infection, implausible time to onset, symptoms pre-existing vaccination or GBS in the context of cerebral infarct.

The upper limit of the 95% confidence interval for the observed to expected ratio did not exceed 1; therefore, a signal was not identified.

Overall, given the totality of the available information, GBS is not considered to be a validated signal, changes in the risk minimization measures or updates to the product information label are not warranted at this time. The benefit risk profile of the vaccine remains favorable. The topic will continue to be closely monitored.

Appendix 3: Cases reporting a fatal outcome

(b) (6)

An 81-year-old patient with a reported time to onset of 54 days. No medical history was reported for the patient. The reported event referred to a worsening in the weakness in both

legs, without any further detail regarding his medical history and the pre-existing weakness in the limb (reported as worsening). The patient's health conditions deteriorated in couple of days (numbness in abdomen, progressive breathing problems) until he was admitted to the hospital and died.

(b) (6)

A 79-year-old male patient received the first dose of BNT162B2 on 19Jan2021 for COVID-19 vaccination. The patient's relevant medical history included Disease Parkinson's, Pre-diabetes, Ischaemic heart Disease under multiple concomitant medication. On 20Jan2021 the patient was admitted to hospital with reduced mobility and was diagnosed with Guillain Barre Syndrome on 20Jan2021. The subject died on 23Feb2021.

(b) (6)

A 76-year-old male patient received first dose of bnt162b2 on unknown date. Medical history included heart disease with 2 stents, hypertension, diabetes, obesity, and hyperlipidemia and was under multiple concomitant medication. Two weeks after receiving the vaccine, the patient experienced urinary incontinence, confusion, lethargy, decreased appetite and taste, weakness, and chills. He was admitted to the hospital few days later and developed fever and thrombocytopenia. On day 5, the patient was then diagnosed with Guillain-Barre Syndrome. MRI was normal, lumbar puncture was consistent with diagnosis with Guillane Barre. He received IVIG x 5days for Guillain-Barre Syndrome and was transferred to a nursing home. He was readmitted to the hospital with dehydration in 04Apr2021 and expired 2 days later (06Apr2021). The patient was negative for COVID-19 in 2021. Autopsy result showed that the patient died of acute renal failure/dehydration second to Guillain barre.

(b) (6)

A 90-year-old female patient received BNT162B2 first dose at the age of 90-years-old on 30Mar2021. The patient's medical history included ongoing hypertension, ongoing diverticulitis, ongoing heart disease, anxiety, pain, eye pressure control and heart disorder and was under multiple concomitant medications. It was reported that upon returning home after the vaccination, the patient was unable to get out of the car as she felt weak and numbness and slurred speech started. The family physician thinks that the patient may have Guillain-Barre Syndrome. On 27Apr2021, the subject was able to ride to get her vaccine once back home she could barely get out of the car, she has been bed ridden ever since and now non-verbal. No treatment was administered. It was further reported that their mother (patient) passed away on 19Apr2021. No autopsy was performed. The patient underwent lab tests and procedures which included SARS-CoV-2 antibody test: negative on Sep2020 and negative on Jan2021.

(b) (6)

An 81-year-old female patient received bnt162b2 on 20Dec2020. Medical history included immunodeficiency, pancytopenia treated with corticosteroids. The patient's concomitant medications were not reported. The patient according to the family, began to deteriorate a few days after the first vaccine, had a fall on the 6th of February and was admitted to a hospital and she complained of leg weakness and soon she lost the ability to walk and developed sensory symptoms. Respiratory problems started on 19th of February, and she died on 21st of February.

090177e19749cf15\Approved\Approved On: 14-Jun-2021 14:01 (GMT)

Clinical suspicion was Guillain-Barre syndrome. Post mortem findings fit with that diagnosis. Patient has not tested positive for COVID-19 since having the vaccine.

090177e19749cf15\Approved\Approved On: 14-Jun-2021 14:01 (GMT)

Pfizer-BioNTech COVID-19 Vaccine

Myocarditis and Pericarditis

Report Prepared by:

BioNTech-Pfizer

The information contained in this document is proprietary and confidential. Any disclosure, reproduction, distribution, or other dissemination of this information outside of BioNTech and Pfizer, its Affiliates, its Licensees, or Regulatory Agencies is strictly prohibited. Except as may be otherwise agreed to in writing, by accepting or reviewing these materials, you agree to hold such information in confidence and not to disclose it to others (except where required by applicable law), nor to use it for unauthorized purposes.

1. INTRODUCTION

Myocarditis is an inflammation of the heart muscle that may present with chest pain, palpitations, arrhythmias, and/or heart failure. It may occur in children and adults and is more common in young men than young women. Myocarditis may be significantly underdiagnosed; depending on the source, the incidence of myocarditis and pericarditis in the European Union ranges from 1 to 10 in 100,000 per year; however, one estimated global prevalence of (pre-Covid pandemic) myocarditis was 22 cases per 100,000 patients. Diagnostic work-up may include serum cardiac biomarkers such as troponins and creatine kinase, electrocardiogram, echocardiography, cardiovascular magnetic resonance imaging and endomyocardial biopsy (diagnostic gold standard). Although a causative agent is frequently not identified, etiologies can include infection (most commonly viral), autoimmune (e.g. sarcoid and systemic lupus erythematosus), and drugs or toxins. In 50% of cases, acute myocarditis resolves quickly within 2-4 weeks; however, 25% may develop persistent cardiac dysfunction and 25% may deteriorate to end-stage dilated cardiomyopathy. Treatment is dependent on presentation and may be directed at a specific etiology, if determined, heart failure and arrhythmias, if present.¹²³

Viral myocarditis in asymptomatic people is a common cause of sudden cardiac death, especially among those younger than 35 years. The incidence of sudden cardiac death in collegiate athletes, for example, has been estimated at 1:50000 per year⁴. In the case of SARS-CoV family of viruses, the viral RNAs of Middle East respiratory syndrome coronavirus (MERS-CoV) and SARS-CoV, which are close relatives of SARS-CoV-2, were found in the heart tissues of infected animals, suggesting that these coronaviruses possess cardiotropism. In the case of SARS-CoV2 specifically, the virus causing COVID-19 disease, case reports and case series following COVID-19 infection. Ho et. al reviewed the literature for cases of myocarditis following COVID-19 and found 51 patients: 12 with confirmed myocarditis (by cardiac magnetic resonance imaging or endomyocardial biopsy) and 39 with possible myocarditis (cardiac biomarkers, ECG and/or echocardiograms). Patients had a median age of 55 years and 69% were male. In general, they presented with the range of symptoms seen in myocarditis of other etiologies. Mortality was 27%.⁵

Pericarditis is an inflammation of the pericardial sac that contains the heart and fixes it to the mediastinum. Males between 20-50 years of age appear to be at highest risk for pericarditis. One incidence has been reported to be about 28 cases per 100,000 in a study of an urban Italian area. Diagnosis of acute pericarditis is made if 2 of 4 clinical criteria are met: (1) Pericardial chest pain, (2) Pericardial rub on auscultation, (3) ECG changes, and (4) Pericardial effusion. Etiologies remain unknown in 40-85% of patients with pericarditis but may be microbial (most commonly viral > bacterial), autoimmune (e.g. systemic lupus erythematosus, rheumatoid arthritis), or neoplastic. It can be self-limiting or complicated by pericardial effusion, and constriction (tamponade). Treatment is directed at inflammation with colchicine or other NSAIDs, aspirin, corticosteroids, and anakinra (IL-1 receptor antagonist). Recurrences occur in about 30% of patients.⁶ Data collected from a Finnish national registry (2000–9) showed a standardized incidence rate of hospitalizations for acute pericarditis of 3.32 per 100,000 person-years. These data were limited to hospitalized patients and therefore may account for only a minority of cases, as many patients with pericarditis are commonly not admitted to hospital. Men ages 16–65 years were at higher risk for pericarditis (relative risk 2.02) than women in the general admitted population, with the highest risk difference among young adults

compared with the overall population. Acute pericarditis caused 0.2% of all cardiovascular admissions. The proportion of admissions declined by an estimated 51% per 10-year increase in age. The in-hospital mortality rate for acute pericarditis was 1.1% and it increased with increasing age and severe co-infections (e.g. pneumonia or septicemia). However, this is a study based on hospital admissions only. Recurrences affect about 30% of patients within 18 months after a first episode of acute pericarditis.⁷

2. RESULTS

2.1. Clinical study data

Unblinded clinical study data from C4591001 (data-lock 13 Mar 2021) was searched for cases of myocarditis and pericarditis. During the blinded placebo-controlled follow-up period, there was one report of myocarditis in the placebo group, and one report of pericarditis in the BNT162b2 group (a 66 year old white male who had pericarditis 29 days after dose 2 of vaccine which was ongoing at the time of the data cut-off. It was assessed as not related to study intervention by the investigator).

2.2. Post-authorization data

2.2.1. Methodology

The safety database was searched for spontaneous reports for Pfizer/BNT COVID-19 vaccine using the search criteria PTs: Pericarditis and Myocarditis, cumulatively to 25 May 2021.

The search identified 495 reports. Two hundred and sixty (260) reports were coded with the PT Myocarditis and 235 coded to Pericarditis, including 25 reports reporting both PTs (Pericarditis and Myocarditis).

2.2.2. Myocarditis

Two hundred and sixty (260) cases reported myocarditis. The criteria used for classifying the cases of Myocarditis were based on Brighton's Collaboration (BC) diagnostic certainty criteria v1.4.2 as: Confirmed (BC 1), Probable (BC 2), Possible (BC 3), Myocarditis not matching levels 1, 2 or 3 (BC 4), and Non Myocarditis cases (BC 5) [see Appendix 1]. Eighteen (18) cases were classified as BC Level 1, 24 cases as BC level 2, 31 cases as BC level 3 and 187 cases as level 4 or 5. Of the 260 reported cases, Israel was the most frequently reporting country (84), followed by United States (50), Germany (39) and the UK (22).

- Of the 18 cases classified as BC level 1, France had 5 reports, UK (4), US (3), Spain and Germany (2 each), and Greece and Italy (1 each). The majority of reports were in younger age groups: 13 cases were below 39 years of age, 1 between 39-59 years, and 3 cases between 59 to 70 years old. There were more males (10) than females (7) and in one (1) case gender was not provided. Ten (10) of these cases had a time to onset of less than 5 days post-vaccination. None of these cases reported histopathology confirmed myocarditis. None had a fatal outcome. Five (5) cases had no alternate

etiology reported. Of them, 3 males and 2 females, ages ranging from 19-66 years old. Three (3) of the Myocarditis events occurred after first dose and the remaining two cases occurred after the second dose. Three (3) cases occurred within the first 48 hours post-vaccination. Four (4) cases had evidence of either current (1) or previous history (3) of SARS-CoV2 infection, age ranged between 28-37 years of age. One (1) case had a past medical history of myocarditis.

- Of the 24 cases identified as BC level 2, US most frequent reporting was the US(8) followed by Germany and Japan (3 each), Italy and France (2 each), The majority of reports were in younger age groups: 15 cases were below 39 years of age, 7 between 39-62 years and the remaining 2 cases were greater than 62 years old (81 and 84). There were more males (16) than females (8). Seventeen (17) of these cases had a time to onset of less than 5 days post-vaccination. No fatal outcome was reported.
- Of the 31 cases identified as BC level 3, Israel was the most frequent reporting country (6) followed by the US and Germany (4 each), Italy and the UK (3 each), and Canada, France, and Ireland (2 each). The majority of reports were in younger age groups: 20 cases were below 39 years of age, 5 cases between 39-62 years and 4 cases between 62 to 85 years old. There were more males (20) than females (11).
- Of the 174 cases identified as BC level 4, Israel was the most frequent reporting country (71) followed by the US (31)- and Germany (30). The majority of reports were in younger age groups: 107 cases were below 39 years of age, 41 cases between 39-62 years and 17 cases between 62 to 85 years old. There were more males (132) than females (39) with 3 unspecified gender.
- Of the 13 cases classified as level BC level 5 pointing to a diagnosis other than myocarditis (Appendix 1), Israel was the most frequent reporting country (7) followed by the US (4). The majority of reports were in the younger age group: 9 cases were below 39 years of age. There were more males (10) than females (2).

The following 5 cases of confirmed myocarditis (BC level 1) did not report information with respect to alternate aetiologies:

(b) (6) : 19-year-old male from France. Medical history not reported. Received his second injection on 18 February 2021. He felt pain in left shoulder 132 hours later, followed by chest pain that required hospitalization. Left ventricular ejection fraction retained followed by inflammatory syndrome and troponin elevation on 21 February 2021. Cardiac MRI showed epicardiac oedema. COVID19 PCR test negative. Event was resolved on an unspecified date. Follow-up per Pfizer processes is occurring.

(b) (6) : 23-year-old female from Greece. No medical history reported. Two days after receiving her second vaccination, experienced fever, acute back pain, shortness of breath and was admitted to hospital on 7 February 2021. ECG and blood test depicted myocarditis coupled with Troponin level elevation to 300. She was later discharged

after event was resolved on 12 February 2021. Follow-up per Pfizer processes is occurring.

(b) (6) : 25-year-old female from the UK, received her first injection on 18Mar2021. On 19Mar2021, she experienced vomiting. On 20Mar2021 she experienced epigastric pain, chest pain, sinus tachycardia and was hypotensive. In the emergency department she had Troponin T 1600, CRP 41, ALT 92. She was not responsive to fluids and required vasopressors. Echo showed thickened pericardium, pericardial effusion, impaired left ventricular function. Six hours into admission the Troponin rose to 21778. Her COVID19 test was negative. No other pertinent information was provided as to medical history, concomitant medications, or diagnostic evaluation. Further attempts of follow-up were not possible. Follow-up per Pfizer processes is occurring.

(b) (6) : 66-year-old male from Germany. No medical history reported. Received his second injection on 6 April 2021. On an unspecified date in the same month he experienced myocarditis. Echo, ECG and cardiac MRI confirmed diagnosis. Troponin level elevated. It was reported cardiac function improved but not yet recovered. Follow-up per Pfizer processes is occurring.

(b) (6) : 44-year-old male from Germany, received his first injection on 17Feb2021. On 05Mar2021, he experienced anginal symptoms and febrile myocarditis. Troponin increased to 1.553ug/ml on 10Mar2021. Echocardiogram was reported to confirm myocarditis on 11 Mar 2021. No other pertinent information was provided as to medical history, concomitant medications, or diagnostic evaluation. Of note, the patient received dose 2 on 10 Mar 2021. Follow-up per Pfizer processes is occurring.

All of the 260 cases of Myocarditis were assessed as serious, with hospitalization as the most common cause of seriousness.

Out of the 260 cases of Myocarditis, the majority of co-reported events were chest pain (66), fever (46), pericarditis (25), dyspnea and headache (24 each). (As shown in table 1 below):

Table 1: Myocarditis – Most common co-reported PTs

PT	Total
Chest pain	66
Pyrexia	46
Pericarditis	25
Dyspnea	24
Headache	24
Troponin increased	23
Chills	20
Fatigue	15
Pain	15
Asthenia	14

Myalgia	14
Chest discomfort	13
Nausea	9
Pain in extremity	9
Pericardial effusion	9
Vomiting	9
Malaise	8

There were 4 cases of myocarditis with fatal outcome, 3 of them described patients 80 years old or greater. One had a history of COVID-19 infection a few weeks prior to vaccination and reported both myocarditis and pericarditis. None of the cases had cardiac imaging or cardiac enzymes information provided. Only one case had a confirmatory autopsy report provided.

(b) (6) : 81-year-old female from Austria with a history of COVID-19 infection in December 2020, meningioma with symptoms of residual hemiparesis, and Type 2 diabetes mellitus. She received her first dose of the Pfizer/BioNtech vaccine on 11 January 2021. She experienced septic shock, extensive myocarditis, pericarditis, and multiple organ failure on 14 January 2021, following 2 days of a cough and cold symptoms. She died on 16 January 2021. No non-invasive or invasive cardiac imaging information was provided. An autopsy performed revealed carditis of the pericardium and myocardium. Etiologic workup of the myocarditis was not provided.

(b) (6) : 80-year-old male from Germany. No medical history was provided. He received the first injection on 07 April 2021. The patient experienced gastric discomfort, vomiting, nausea, myocarditis, and dyspnea on 12 April 2021. The patient died on 22 April 2021. No other relevant information was provided. No autopsy was performed.

(b) (6) : 47-year-old male from Israel. Medical history includes hypertension, hypercholesterolemia, hypothyroidism, diabetes with end organ damage. The patient received his two doses of vaccine on unspecified dates. He was brought to the ED after an unspecified time post vaccination with fever for 3 days, difficulty breathing, cough, and myocarditis. He was anesthetized and resuscitated due to his rapidly deteriorating condition. The patient died due to myocarditis on an unspecified date. No cardiac imaging data was provided. No further diagnostic or etiologic evaluation was provided. No autopsy was performed.

(b) (6) : 83-year-old female from Germany. No medical history was provided. She received the first injection on 08 March 2021. On 12 March 2021, she experienced bloody stools, tachycardia, hypotension, anaemia normocytic, hyponatremia, pericardial effusion, cardiogenic shock. No further diagnostic or etiologic evaluation was provided. She died on 27 April 2021. Autopsy data were not provided.

2.2.3. Pericarditis

There was a total of 235 cases with a PT of Pericarditis out of total 233,083 cases in the database (0.001% to total cases). The events were evaluated based on the European Association for Cardio-Thoracic Surgery (EACTS) criteria (6) for evaluation of the status of pericarditis (4):

Acute: At least two of the following criteria:

- 1- Pericardiac chest pain
- 2- Pericardial rubs
- 3- Widespread ST elevation or PR depression in ECG
- 4- Pericardial effusion.

Incessant: Pericarditis lasting more than 4-6 weeks but less than 3 months without remission

Recurrent: Recurrence of pericarditis after a documented first episode of acute pericarditis and a symptom-free interval for 4-6 weeks or longer

Chronic: Pericarditis lasting for more than 3 months

Out of the total number of cases (235), there were 10 cases assessed as recurrent due to past history of myocarditis, while 1 assessed as incessant, and the remaining cases, 224, were assessed as acute pericarditis.

The most frequent country of reported Pericarditis cases was the US (47) followed by Israel (46), France (41), UK (25), and Italy (18).

The majority of pericarditis cases were males (119) compared to females (114). The age ranged from 16 to 92 years of age, with 131 cases occurring after the first vaccination while 85 cases occurred after the second vaccination (remaining cases unknown dose number).

There were 15 cases with history of pericarditis, while 11 cases had history of COVID-19 infection. There were 102 cases that had an ECG and/or laboratory tests reported.

Time to onset of pericarditis was:

- Same day as vaccination: 11
- Day after vaccination: 34
- 2 to 5 days after vaccination: 62
- 6 to 10 days after vaccination: 17
- 11 to 21 days after vaccination: 43

The most commonly co-reported adverse event with Pericarditis was chest pain (63) followed by dyspnea (31), and myocarditis (25). (As shown in table 2 below):

Table 2: Pericarditis – Most common co-reported PTs

PT	Total
Chest pain	63
Dyspnea	31
Myocarditis	25
Pyrexia	22
Pericardial effusion	20
Fatigue	15
Arthralgia	13
Malaise	13
Myalgia	13
Headache	12
Pain	12
Asthenia	8
Troponin increased	8
Chest discomfort	7
C-reactive protein increased	7
Dizziness	7
Tachycardia	7

There was 1 case of pericarditis with fatal outcome:

(b) (6) : 72-year-old female from the UK with a medical history of cardiac arrest, chest pain, high cholesterol, AML, and hypertension. She had recent chemo/radiation therapy). She received the vaccine on 18Feb2021. On 21Feb2021 she experienced chest pain and shortness of breath. The patient underwent lab tests and procedures which included COVID-19 virus test: negative on 21Feb2021, computerised tomogram (CTPA): pericardial effusion and bilateral basal atelectasis. Patient was diagnosed with pericarditis on 21Feb2021. On 25Feb2021 patient experienced cardiac arrest 2 times with return of spontaneous circulation in between, then experienced pulseless electrical activity (PEA) arrest. The patient died on 26Feb2021 reportedly due to pericarditis. Etiologic workup of the myocarditis was not provided. An autopsy was not performed.

2.2.4. Both Pericarditis and Myocarditis

There were 25 reports that coded both myocarditis and pericarditis. For these cases, ages ranged from 17 to 81 years and there were 18 males and 7 females. The most reporting countries were Israel (11) and US (5). The majority (11) of cases occurred after the first day post-vaccination. Only 1 event had a fatal outcome (explained above). All 25 cases have already been described in sections 3.2.1 and 3.2.2.

2.3. Israel Cases

2.3.1. Myocarditis - cases reported from Israel

Of the 260 cases of myocarditis, there were 84 cases reported from Israel, the ages ranged from 16 to 75 years and there were 75 males and 9 females. The majority of the 84 cases (81) were assessed as BC Level 4 or 5 due to limited information provided at this time. The remaining four cases were BC 3.

2.3.2. Pericarditis – cases reported from Israel

Out of the 235 cases of pericarditis, there were 46 cases reported from Israel. The ages ranged from 17 to 75 years. There were 30 males and 16 females. There were 19 cases occurring after dose 1, and 16 occurred after dose 2 (the remainder were unspecified). None of the cases had history of pericarditis or COVID-19 infection.

3. EPIDEMIOLOGY

The MAH conducted age-stratified observed to expected (O/E) analyses for spontaneously reported myocarditis and pericarditis cases through 31 May 2021 for select European Economic Area (EEA) countries and the United States (Table 1 and Table 2). For an age-stratified analysis of myocarditis in select EEA countries (excluding the US) refer to [Appendix 5.1](#). In both analyses, the O/E ratios for both myocarditis and pericarditis were less than 1 across all age groups. Ratios were higher in the younger age groups.

Table 1. Age-Stratified Observed to Expected (O/E) Ratios of Spontaneously Reported Adverse Events of Special Interest (AESI) in Select EEA Countries and the US through 31 May 2021, 21-Day Risk Window

AESI	18-24 years		25-49 years		50+ years	
	O/E Ratio	95% CI	O/E Ratio	95% CI	O/E Ratio	95% CI
Myocarditis	0.25	0.162, 0.369	0.113	0.083, 0.150	0.026	0.017, 0.038
Pericarditis	0.096	0.053, 0.161	0.075	0.056, 0.097	0.044	0.034, 0.054

Table 2. Age-Stratified Analysis Observed (Obs) and Expected (Exp) Cases through 31 May 2021 and Background (Bkgd) Rates of Spontaneously Reported Adverse Events of Special Interest (AESI) in Select EEA Countries and the US, 21-Day Risk Window

f. Elfström 2007

3.1. Observed and expected cases

Spontaneously reported case counts were processed from the safety database via the pre-defined MedDRA preferred term search criteria, myocarditis and pericarditis, through 31 May 2021. Cases were limited to those occurring in the United States and the following EEA countries: Austria, Belgium, Bulgaria, Croatia, Cyprus, Czechia, Denmark, Estonia, Finland, France, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Norway, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, and Sweden. Cases were then grouped by the following age groups: 18-24 years, 25-49 years, and 50+ years. Cases <18 years were excluded.

Expected case counts were determined by multiplying estimated background incidence rates by the duration of post-vaccination exposure time estimated for a 21-day risk window.

3.2. Background incidence rates

Age-specific background rates for myocarditis were obtained from the ACCESS project.⁸ The Italian ARS dataset was selected based on the range of observed values and relevant characteristics of the database. Age-specific background rates for pericarditis were not available from ACCESS, so a rate selected from the literature was applied across all age groups.⁹

3.3. Post-vaccination exposure time

Age stratified estimated exposure time for EEA countries was derived from the ECDC data on COVID-19 vaccination in the EU/EEA.¹⁰ Estimates were limited to the following countries reporting age-specific administration data: Austria, Belgium, Bulgaria, Croatia, Cyprus, Czechia, Denmark, Estonia, Finland, France, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Norway, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, and Sweden. Exposure time for the United States was derived from the Our World in Data COVID-19 data.¹¹ Vaccine administrations were limited to the Pfizer-BioNTech COVID-19 vaccine. Exposure time was calculated using a 21-day risk window.

Of note, the 21-day risk window is not applied to the observed case count. All cases observed through 31 May 2021 are included regardless of proximity of event to date of vaccination. This is a conservative approach for the purpose of signal detection.

3.4. Limitations

Several limitations of the observed to expected comparison must be noted. With respect to observed cases, case ascertainment through the spontaneous reports likely reflect an underreporting due to incomplete reporting or a lag in reporting. Additionally, spontaneous surveillance systems are prone to reporting bias whereby events that have been previously identified as potentially related to the vaccine are more likely to be reported despite not meeting the clinical definition. Conversely, events that have not been previously associated with a vaccine are likely to be underreported.

With respect to the expected case counts, estimates concerning both exposure to vaccine and the background rate have limitations. Our exposure estimate assumes that the number of reported administrations is complete and accurate.

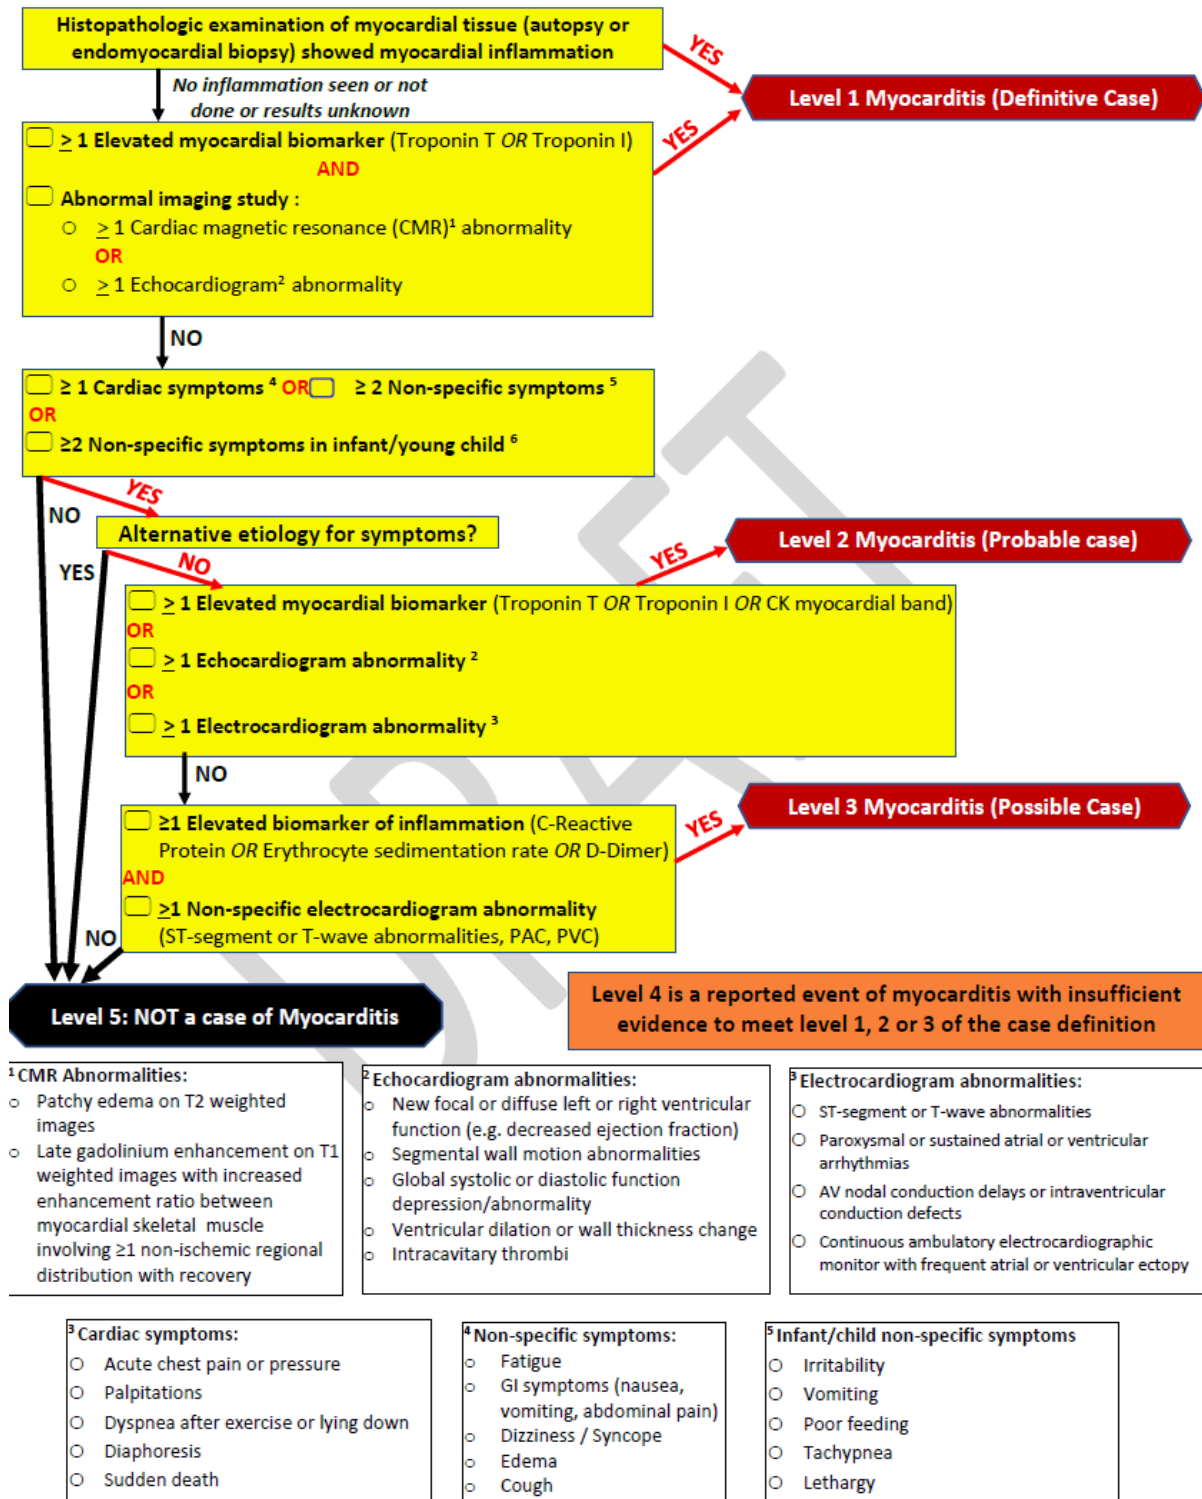

The expected count assumes that the expected incidence rate in the vaccinated population is the same as that in the population used to calculate the background rate, and the same across age groups. However, it is possible that the delivery of health care, population demographics, and underlying health status of the population used for the background rate estimate differ from those expected in the vaccinated population and across age groups.

A further limitation concerns the risk window, the period during which one is expected to be at risk of a given event if there is a causal association between the event and the vaccine. The 21-day risk window is particularly conservative as all observed cases are included in the numerator of the O/E ratio regardless of the days since vaccination dose, which will lead to an overestimation of the ratio if observed cases occurred outside of the risk window.

4. SUMMARY AND CONCLUSION

In the context of over 600 million doses of the vaccine distributed, there have been 495 reports of potential myocarditis or pericarditis events. Two hundred and sixty (260) reports were coded with the PT Myocarditis and 235 coded to Pericarditis. There is a dearth of information provided with respect for the investigations into viral or other aetiologies; however, the characteristics of the reports are consistent with the usual presentation of the disease (i.e. age and sex). The rate at which these events are reported (even without applying the diagnostic certainty criteria) do not exceed the expected background rate. It should be noted that with the case information currently available, only 18 (6.9%) of the cases could be assessed as “confirmed cases” of myocarditis as per Brighton Collaboration criteria. It is worth noting that the incidence rate of myocarditis in COVID-19 infected patients is 2.3 out of 100 in a recovering population.⁵ Given the totality of the data, a causal association between the vaccine and myocarditis or pericarditis cannot be established. The MAH will continue to perform robust pharmacovigilance, follow up, and monitoring of this topic.

APPENDIX 5.1 OBSERVED VERSUS EXPECTED ANALYSES FOR ADVERSE EVENTS OF SPECIAL INTEREST

2.5. INTRODUCTION

As part of ongoing signal detection activities, MAH is conducting observed versus expected analyses to determine whether the reported counts of spontaneously reported adverse events of special interest (AESI) are higher than expected based on the “natural” background rates of the AESI in the absence of vaccine exposure, as outlined in the “Considerations on core requirements for RMP’s of COVID-19 vaccines: coreRMP19 guidance”¹ and by Mahaux et al.² Analyses are reported cumulatively for the period since the vaccine was first granted emergency use authorization (01 December 2020) as well as for the monthly reporting interval (30 April 2021 – 31 May 2021).

2.6. METHODS

2.6.1. Overall analyses

2.6.1.1. Variables

The AESI list included in the overall analyses is informed by recommendations from the following expert groups and regulatory authorities: Brighton Collaboration (SPEAC), ACCESS protocol, US CDC (VAERS surveillance) and MHRA. For SMSR 6, the MAH has added appendicitis and stress cardiomyopathy to the overall observed to expected ratio analyses compared to SMSR 5.

2.6.1.2. Observed cases

Spontaneously reported case counts are processed from the safety database via the pre-defined MedDRA preferred term search criteria provided in Table 1. Unless otherwise noted, events have not undergone adjudication, which is considered appropriate in a setting where the goal of observed versus expected analyses is signal detection.²

Table 1. Preferred Terms (PT) Used to Identify Spontaneously Reported Adverse Events of Special Interest (AESI)

AESI	PTs
Acute disseminated encephalomyelitis (ADEM)	Acute disseminated encephalomyelitis, Encephalitis, Encephalopathy
Acute kidney injury/renal failure	Acute kidney injury, Renal failure
Acute liver injury/liver injury	Liver injury
Acute myocardial infarction/myocardial infarction	Acute myocardial infarction, Myocardial infarction
Acute respiratory distress syndrome (ARDS)	Acute respiratory distress syndrome
Ageusia/anosmia	Ageusia, Anosmia
Appendicitis	Appendicitis
Arrhythmia	Arrhythmia
Autoimmune thyroiditis	Autoimmune thyroiditis
Behcet’s syndrome	Behcet’s syndrome
Bell’s palsy	Facial paresis, Facial paralysis, Oculofacial paralysis, Bell’s palsy
Chillblains	Chillblains
Chronic fatigue syndrome/ME/PVFS	Chronic fatigue syndrome, Post viral fatigue syndrome

Table 1. Preferred Terms (PT) Used to Identify Spontaneously Reported Adverse Events of Special Interest (AESI)

AESI	PTs
Coronary artery disease	Coronary artery disease
Cutaneous vasculitis	Cutaneous vasculitis, Vasculitic rash, Urticarial vasculitis
Death	Fatal clinical outcome
Deep vein thrombosis	Deep vein thrombosis
Disseminated intravascular coagulation	Disseminated intravascular coagulation
Erythema multiforme	Erythema multiforme
Fibromyalgia	Fibromyalgia
Giant cell arteritis	Giant cell arteritis
Guillain-Barré syndrome	Guillain-Barre syndrome
Haemorrhage	Haemorrhage
Haemorrhagic stroke	Haemorrhagic stroke, Cerebral haemorrhage, Cerebral haematoma, Subarachnoid haemorrhage, Brain stem haemorrhage, Haemorrhage intracranial, Intracranial haematoma
Heart failure	Cardiac failure, Cardiac failure acute
Herpes zoster	Herpes zoster, Ophthalmic herpes zoster, Herpes zoster reactivation, Herpes zoster infection neurological, Herpes zoster oticus, Herpes zoster cutaneous disseminated, Varicella zoster virus infection
Idiopathic thrombocytopenic purpura, autoimmune thrombocytopenia	Immune thrombocytopenia, Thrombocytopenia, Thrombotic thrombocytopenic purpura, Thrombocytopenic purpura
Ischemic stroke	Ischaemic stroke, Cerebrovascular accident, Cerebral infarction, Basal ganglia stroke, Cerebral thrombosis, Cerebral venous sinus thrombosis, Thrombotic stroke, Basal ganglia infarction, Basilar artery thrombosis, Brain stem stroke, Lacunar infarction
Limb ischemia	Peripheral ischaemia
Meningitis	Meningitis, Meningitis aseptic
Multiple sclerosis (MS)	Optic neuritis, Multiple sclerosis relapse, Multiple sclerosis
Multisystem inflammatory syndrome	Systemic inflammatory response syndrome, Multiple organ dysfunction syndrome, Multisystem inflammatory syndrome in children
Myasthenia gravis	Myasthenia gravis
Myocarditis	Myocarditis
Narcolepsy	Cataplexy, Narcolepsy
Pericarditis	Pericarditis
Polyneuropathy	Polyneuropathy, Neuropathy peripheral
Postural orthostatic tachycardia syndrome	Postural orthostatic tachycardia syndrome
Pulmonary embolus	Pulmonary embolism
Rheumatoid arthritis, polyarthritis	Rheumatoid arthritis, Polyarthritis
Seizures/convulsions/seizure disorders (including febrile)	Febrile convulsion, Seizure, Generalized tonic-clonic seizure, Partial seizures
Stress cardiomyopathy	Stress cardiomyopathy
Transverse myelitis	Myelitis transverse, Myelitis
Type 1 diabetes	Type 1 diabetes mellitus
Vasculitis	Vasculitis, Polymyalgia rheumatica

2.6.1.3. Expected cases

Expected case counts were determined cumulatively and for the monthly interval by multiplying estimated background incidence rates by the duration of post-vaccination exposure time.³ Duration of exposure time was estimated for the cumulative and interval period using a 21-day risk window and no risk window.³

2.6.1.3.1. Background incidence rates

Background incidence rates were obtained from the ACCESS project where available. Data access providers were selected for each AESI based on the range of observed values, type of care typically sought for the AESI (e.g. hospital or general practitioner), and relevant characteristics of the databases, as described in the ACCESS User Guide⁴. Incidence rates were then averaged for the most recent three years of data available, excluding 2020, within each data access provider. The most recent data available on the ACCESS dashboard were used to calculate incidence rates. This caused several of the incidence rates to change from those used in SMSR 5, which were calculated based on an older version of the ACCESS data.

For AESIs not available through the ACCESS project, incidence rates were identified in the literature and analyses conducted within electronic health records. If a plausible range of background rates was identified across multiple data sources, a single rate from the low end of the range was selected. This conservative approach is more likely to identify a signal than an approach using a higher background rate.

The MAH re-evaluated the appropriate source for background incidence rate used for acute disseminated encephalomyelitis (ADEM). In SMSR 5, a background rate of 0.1 per 100,000 person years from the ACCESS project was used, which is derived from medical records coded as ADEM only. For this SMSR, a background rate of 5.3 per 100,000 person years from the ADVANCE project, which uses a broader concept of ADEM that includes encephalitis, encephalomyelitis, and encephalopathy, was used. This higher background rate is justified to better align with the spontaneously reported cases, which includes PT codes for acute disseminated encephalomyelitis, encephalitis, and encephalopathy.

Compared to SMSR 5, background rates for the following AESIs were updated to reflect changes in the ACCESS data: acute kidney injury/renal failure, acute liver injury/liver injury, chillblains, disseminated intravascular coagulation, idiopathic thrombocytopenic purpura, autoimmune thrombocytopenia, and type 1 diabetes. The following AESIs were removed from the ACCESS data, so updated background rates from the literature or alternate sources were used: deep vein thrombosis, pulmonary embolus, and vasculitis. Background rates for the following AESIs were updated to align with the data access provider selected for the age-specific background rates described in section 2.6.2.3.1: acute respiratory distress syndrome, ageusia/anosmia, arrhythmia, cutaneous vasculitis, erythema multiforme, Guillain-Barré syndrome, haemorrhagic stroke, heart failure, ischemic stroke, multisystem inflammatory syndrome, myocarditis, narcolepsy, and seizures/convulsions/seizure disorders (including febrile).

Sources of background incidence rates are referenced in [Table 3](#).

2.6.1.3.2. Post-vaccination exposure time

Estimated exposure time was derived from two publicly available sources, the European Centre for Disease Prevention and Control (ECDC) data on COVID-19 vaccination in the European Union (EU)/ European Economic Area (EEA) and the Our World in Data (OWD) COVID-19 data.^{5,6} For countries represented in both data sources, the ECDC data was prioritized over the OWD data. Within the OWD data, the dataset with information on manufacturer was prioritized over global administration data. When available, vaccine administrations were limited to the Pfizer-BioNTech COVID-19 vaccine. For countries where the Pfizer-BioNTech COVID-19 vaccine is authorized but manufacturer stratified data were not available, the doses administered were assumed to be divided equally by the number of brands of vaccines authorized during that period. The estimate of administered doses does not reflect exposure in persons vaccinated in countries that did not publicly report. Exposure time was calculated using a 21-day risk window and no risk window for both the interval and cumulative period.

Of note, the 21-day risk window is not applied to the observed case count. All cases observed during the interval or cumulative period are included regardless of proximity of event to date of vaccination. This is a conservative approach for the purpose of signal detection.

2.6.2. Age-stratified analyses

2.6.2.1. Variables

Age-stratified analyses were performed on a subset of the AESIs included in the overall analyses. The subset of AESIs was selected based on those with available age-specific background rates from the ACCESS project.

2.6.2.2. Observed cases

Spontaneously reported case counts are processed from the safety database via the pre-defined MedDRA preferred term search criteria provided in [Table 1](#). Unless otherwise noted, events have not undergone adjudication, which is considered appropriate in a setting where the goal of observed versus expected analyses is signal detection.² Cases were limited to those occurring in the following EEA countries providing age-specific vaccine administration data through ECDC necessary to determine expected counts (section [2.6.2.3.2](#)): Austria, Belgium, Bulgaria, Croatia, Cyprus, Czechia, Denmark, Estonia, Finland, France, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Norway, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, and Sweden. Cases were then grouped by the following age groups: 18-24 years, 25-49 years, 50-59 years, 60-69 years, 70-79 years, and 80+ years. Cases <18 years were excluded. Cases with only the broad age group of “adult” available were divided equally between all age groups. Cases with only the broad age group of “elderly” available were divided equally between the 60-69 years, 70-79 years, and 80+ years age groups. Cases with unknown age were divided equally between all age groups.

2.6.2.3. Expected cases

Expected case counts were determined cumulatively and for the monthly interval by multiplying estimated background incidence rates by the duration of post-vaccination

exposure time. Duration of exposure time was estimated for the cumulative and interval period using a 21-day risk window.

2.6.2.3.1. Background incidence rates

Age-specific background rates for all AESIs except death were obtained from the ACCESS project. Data access providers were selected for each AESI based on the range of observed values, type of care typically sought for the AESI (e.g. hospital or general practitioner), and relevant characteristics of the databases, as described in the ACCESS User Guide.⁴ To align with the age groups available for post-vaccination exposure time, the background rate for the ACCESS age group of 20-29 was used for the 18-24 years age group, and the average of the background rates for the ACCESS age groups 20-29 years, 30-39 years, and 40-49 years was used for the 25-49 years age group. The data access providers and background rates selected for each AESI are provided in [Table 8](#).

2.6.2.3.2. Post-vaccination exposure time

Age stratified estimated exposure time was derived from the ECDC data on COVID-19 vaccination in the EU/EEA. Estimates were limited to the following countries reporting age-specific administration data: Austria, Belgium, Bulgaria, Croatia, Cyprus, Czechia, Denmark, Estonia, Finland, France, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Norway, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, and Sweden. Vaccine administrations were limited to the Pfizer-BioNTech COVID-19 vaccine. Exposure time was calculated using a 21-day risk window for both the interval and cumulative period.

Of note, the 21-day risk window is not applied to the observed case count. All cases observed during the interval or cumulative period are included regardless of proximity of event to date of vaccination. This is a conservative approach for the purpose of signal detection.

2.7. RESULTS

2.7.1. Overall analysis

Table 2. Observed to Expected (O/E) Ratios of Spontaneously Reported Adverse Events of Special Interest (AESI)

d. 5,410,179 PY

For most cumulative and interval data, the upper limit of the 95% CI is substantially less than 1. For most AESI, the ratio is higher in the interval period than in the cumulative even when restricted to the 21-day risk window. This could reflect changes in the accuracy of the person year estimate, an increased reporting rate over time, an increased reporting rate with second dose as the proportion of vaccinees receiving a second dose is increasing over time, higher rates of spontaneous event reporting in countries where the vaccine was recently authorized, or a combination of these.

For purposes of signal detection in the overall analyses, the MAH considers events for which the upper level of the 95% CI exceeds 1 for at least one of the risk periods (cumulative, interval) or risk windows (21 weeks, no risk window). While typically the lower level of the 95% CI would be the criterion for evaluating a difference from expectation, in this setting, given the generally substantial gap between the lower limit and 1, an upper limit in excess of 1 might suggest the possibility of an excess risk in vaccinees.

Myasthenia gravis and transverse myelitis are further discussed below.

2.7.2. Age-stratified analysis

Table 4. Age-Stratified Observed to Expected (O/E) Ratios of Spontaneously Reported Adverse Events of Special Interest (AESI), 21-Day Risk Window, Interval

090177e19749cf15\Approved\Approved On: 14-Jun-2021 14:01 (GMT)

For most cumulative and interval data, the O/E ratio is substantially less than 1. For most AESI in the younger age groups, the O/E ratio is higher in the cumulative period than the interval period, while in the older age groups the ratio is higher in the interval period. This could reflect differences in the accuracy of the person year estimate by age or interval period, an increased reporting rate with second dose as the proportion of vaccinees receiving a second dose is increasing over time, lower rates of spontaneous event reporting in countries where the vaccine was recently authorized, differences in event reporting by age, or a combination of these.

For purposes of signal detection in the age stratified analyses, the MAH considers events for which the O/E ratio exceeds 1 for at least one of the risk periods (cumulative, interval). Although the upper level of the 95% CI was used as the criterion in the overall analyses, due to the low person year estimates and variability in background rates, the O/E ratio is used as the criterion in the age stratified analyses.

Guillain-Barré syndrome, multisystem inflammatory syndrome (MIS), and transverse myelitis are further discussed below.

2.8. DISCUSSION

In general, the O/E ratios across all AESIs are lower in this SMSR than in the April 2021 SMSR. This is in part due to the revised method for calculating person years of exposure time, which uses available data on vaccines administered by manufacturer rather than assuming an equal distribution of approved vaccines.

2.8.1. Cardiogenic shock and hypertension

Although requested by regulatory authorities, cardiogenic shock and hypertension were not able to be included in this analysis since relevant background rates have not been identified at this time.

2.8.2. Overall analyses: myasthenia gravis and transverse myelitis

For myasthenia gravis, the upper level of the 95% CI exceeds 1 for at least one of the risk windows in at least one of the risk periods in the overall analysis, suggesting the possibility that the true O/E ratio may exceed 1. For myasthenia gravis, the 95% CI exceeds 1 for both the 21 day and no risk windows in the interval period, and for transverse myelitis, the 21 day risk window in both the cumulative and interval periods and the no risk window interval period.

Myasthenia gravis and transverse myelitis were previously found to have an upper limit of the 95% CI of O/E ratio greater than 1 and were reviewed in detail in the March 2021 SMSR; the signals were determined not to be validated. The O/E ratios for myasthenia gravis in this SMSR period are similar to or lower than the ratios reported in previous SMSR periods. For transverse myelitis, the adoption of the ACCESS narrow background rate of 0.35 per 100,000 person years starting in the April 2021 SMSR resulted in higher O/E ratios than in previous SMSRs. Of note, the definition for spontaneously reported cases of transverse myelitis includes PT codes for myelitis transverse and myelitis, while the ACCESS background rate

only includes transverse myelitis. The O/E ratios for transverse myelitis in this SMSR period are lower than the ratios reported in the April 2021 SMSR.

2.8.3. Age stratified analyses: Guillain-Barré syndrome, multisystem inflammatory syndrome, and transverse myelitis

In the age stratified analyses, the O/E ratio exceeds 1 for at least one of the risk periods in at least one of the age groups for Guillain-Barré syndrome, MIS, and transverse myelitis. For Guillain-Barré syndrome, the O/E ratio was elevated in the 80+ years age group, for MIS in the 25-49 years and 50-59 years age groups, and for transverse myelitis in the 25-49 years and 70-79 years age groups. A relatively low number of cases were seen within age groups; for MIS and transverse myelitis, three or fewer cases caused the O/E ratio to exceed 1.

As requested, the MAH included age stratified analyses for EEA countries. No trends of O/E ratios exceeding 1 were noted across age groups as would be expected with a true increased risk. Low exposure estimates and underestimated age specific background rates could be contributing to the variability seen in these analyses. The MAH will continue to monitor Guillain-Barré syndrome, MIS, and transverse myelitis.

2.8.4. Limitations

There are several limitations to observed to expected analyses for signal detection. The observed case counts are likely to be underestimated due to underreporting that occurs with spontaneous report surveillance. Additional reasons for underestimations include incomplete reporting and lags in reporting. Spontaneous surveillance systems are prone to reporting bias whereby events that have been previously identified as potentially related to vaccine are more likely to be reported even if they do not meet the clinical definition. Conversely, events that have not been previously associated with a vaccine are more likely to be underreported due to lack of recognition of a potential association.

With respect to the expected case counts, estimates of both exposure to vaccine and the background rate have limitations. The exposure estimate assumes that the number of reported vaccine administrations is complete and accurate when in fact not all countries administering vaccine have reported to the data source. Thus, the exposure is underestimated.

The expected count also assumes that the expected incidence rate in the vaccinated population is the same as that in the population used to calculate the background rate. The background rates used in these analyses are primarily derived from EU health care systems; while the age stratified analyses were limited to EU data, for the overall analyses a large proportion of exposure data derive from the US. It is possible that the delivery of health care, population demographics, and underlying health status of the populations used for the background rate estimates differ from those expected in the vaccinated population.

A final limitation concerns the risk window, the period during which one is expected to be at risk of a given event if there is a causal association between the event and the vaccine. For the overall analyses, two periods, 21 days and no risk window, were selected to provide an estimate assuming a more acute onset (21-day window) and a more latent onset (no risk window). The 21-day risk window is particularly conservative as all observed cases are

included in the numerator of the O/E ratio regardless of the days since vaccination dose, which will lead to an overestimation of the ratio if observed cases occurred outside of the risk window.

2.9. OBSERVED VERSUS EXPECTED ANALYSES FOR ANAPHYLAXIS (IDENTIFIED RISK)

Since anaphylaxis has already been identified as a risk, the goal of the observed versus expected analysis is risk estimation rather than signal identification. Risk of anaphylaxis is reported per dose administered and compared to rates of anaphylaxis observed for other vaccines rather than rates in an unexposed population.

The MAH has conducted unadjusted observed versus expected analyses for the 2,980 cumulative cases of anaphylaxis reported through 31 May 2021. Anaphylaxis cases were identified using the following PTs: anaphylactic shock, anaphylactic reaction, anaphylactoid shock, and anaphylactoid reaction. A background rate of 1.31 anaphylaxis cases per million vaccine doses was assumed.²⁸

An estimated 542,013,978 doses of Pfizer-BioNTech COVID-19 vaccine have been administered through 31 May 2021. Approximately 85% of shipped doses of the Pfizer-BioNTech COVID-19 vaccine are administered in the European Union and the United States. This administration estimate was applied to the 639,868,710 doses shipped worldwide through 31 May 2021.

Expected counts were determined by multiplying the number of doses administered by the expected rates per dose.

An O/E ratio of 4.182 (95% CI 4.034, 4.335) was observed for BNT162b2 compared to the background rate for anaphylaxis cases observed in the US. This rate has declined from the 4.247 (95% CI 4.055, 4.444) reported in SMSR 5 (through 29 April 2021), the 5.12 (95% CI 4.85, 5.41) reported in SMSR 4 (through 31 March 2021), the 7.76 (95% CI 7.22, 8.33) reported in SMSR 3 (through 28 February 2021) and the 9.47 (95% CI, 8.61, 10.40) reported in SMSR 2 (through 31 January 2021). The reason for the decline is unknown but could reflect decreased reporting, changes in the accuracy of the exposure estimate, or changes in population being vaccinated.

There are several limitations to consider when interpreting these analyses. The analyses did not adjust for differences in characteristics such as age and comorbidities between persons being administered the vaccine and populations from which the background rate was derived. The spontaneous report system likely underestimates the true number of observed events in vaccinated persons due to incomplete or a lag in reporting.

Conversely, spontaneous report systems are prone to reporting bias whereby events that have been previously identified as potentially related to a vaccine are more likely to be reported than other events, for example, due to increased media attention. With respect to the expected case counts, estimates of both exposure to vaccine and the background rate have limitations. The exposure estimate assumes that 85% of all shipped doses are administered in each

country. The true number of vaccines administered may be higher or lower than this estimate.

Additionally, there are differences in health care delivery, demographics, and underlying health status in the populations used to calculate background rate estimates compared to those in the population administered the vaccine.

APPENDIX 6. LITERATURE REVIEW IN THE REPORTING PERIOD (METHODOLOGY)

A web-based literature review service is used to review medical literature from clinical and non-clinical literature sources for significant safety information relevant to authorized Pfizer medicinal product including reviews and practice guidelines.

The following bibliographic databases are searched in this order:

1. MEDLINE®
2. Embase

Each search uses controlled vocabulary terms that are unique to each database. For each database, the search focuses on the following:

- AEs, effects and outcomes
- Generic name of the drug
- Prenatal and perinatal exposure and exposure through breast milk
- Drug interactions
- Clinical studies
- Epidemiology and meta-analyses
- Poisoning and toxicity
- Drug resistance and drug tolerance
- Toxicity tests

Searches are limited by date and by literature type. Editorials, and news reports (i.e., works consisting of an announcement or statement of recent or current events of new data and matters of interest in the field of medicine or science) are excluded because they are not peer-reviewed.

APPENDIX 7. OVERVIEW OF INTERVAL CASES NOT INCLUDED IN THE MAY 2021 SMSR

Among cases received or downloaded to the safety database during the Summary Monthly Safety Report (SMSR) reporting period, only those having a complete workflow cycle in the safety database (meaning they progressed to Distribution or Closed workflow status at least once) are included in that month's SMSR. This approach prevents the inclusion of cases that are not fully processed hence not accurately reflecting final data. As per monthly routine process, Pfizer applies a Late condition process that retrieves from the global safety database cases received but not captured in the previous month's SMSR due to lack of completeness. This condition ensures that no relevant cases are excluded from the SMSRs over time.

For the reporting period 30 April 2021 to 31 May 2021, there was a total of 74,903 case reports retrievable from the global safety database based on the Initial Safety Receipt Date; 59,903 case reports out of the 74,903 retrieved did not meet the defined criteria for inclusion in the May's SMSR and therefore are not included in the current SMSR.ⁱ

The table below presents the most frequently reported events by SOC and by PT for events reported in ($\geq 1\%$) of the cases not included in the current SMSR.

Events Reported in $\geq 1\%$ in Cases* not Included in the 6th SMSR

MedDRA SOC MedDRA PT	30 April 2021 Through 31 May 2021 AEs (AERP%) N = 59,903

a. Listed or consistent with listed AEs in current RSI;

b. Listed per case processing convention;

c. Consistent with anaphylactic reactions listed in the current RSI;

e. Evaluated and determined not to be a risk.

* Reporting proportion (% of total cases) in the current reporting period.

Most of the frequently reported events are listed or consistent with listed events as per the current RSI.

ⁱ There was a total of 47,174 case reports included in the May's SMSR, of which 15,000 captured based on their Initial Safety Receipt Date and 32,174 case reports captured applying the Late condition.

APPENDIX 8. Q&A SECTION – EMA PRAC REQUESTS FOR NEXT SMSR

QUESTION 1

As part of Good Vigilance Practice the MAH is expected to quickly provide and take into account actual exposure data (i.e. of the signaling country) when evaluating unexpected trends in adverse event reporting (i.e. regarding seriousness, frequency, age, gender or patient population), especially when relevant to confirming/refuting potential safety signals. This applies to both EU/EEA and non-EU/EEA countries.

Response:

The MAH acknowledges this expectation and will provide exposure data, when available and as applicable, for countries from which a safety signal emerges.

QUESTION 2

The MAH states that 3,573 cases (22.4%) of the 15,937 downloaded cases are included in the dataset reviewed in this 5th MSSR of which 3,374 are serious cases; compared to 19.5% of the previous reporting period. Not included in this 5th MSSR are 2,067 serious cases and 10,297 non-serious cases. Although some improvement is reported in the relative number of processed adverse events, it is still worrisome that only 22.4% of the total number of cases are reviewed in the present reporting period. It is unclear if all serious AESI cases have been included in the current MSSR. Therefore, the MAH is requested to indicate in future MSSRs what proportion of the serious AESI cases is included in the present MSSR. In addition, the MAH should clearly report the root cause for this delay, the corrective actions in place, the availability of this cases in the EV database and how the totality of the cases are being managed in their relevant signal procedure. It should also be highlighted to the MAH that reports including AESIs or reports that are PRAC requests within the different ongoing procedures should be highly prioritized.

Response:

As per data (as of 01 June 2021), of the 19,757 cases downloaded from EudraVigilance for the period covered by the sixth SMSR, 5,230 cases (26,5 % of the total downloaded cases) are included in the data tabulations presented in this SMSR. Of the 5,230 cases included, 4,936 are serious. Of the 5,230 EudraVigilance cases included, 3,684 are serious cases reporting Adverse Events of Special Interest (AESI). All COVID-19 vaccine cases received are included in Pfizer's signal management activities and discussed in this SMSR irrespective of workflow status once minimal data (Country of Origin and adverse event term) is entered into the safety database.

The remaining 14,527 cases downloaded from EudraVigilance in May 2021 are not included in the data tabulations of this SMSR as they have not yet completed case processing; this includes reports downloaded immediately prior to the datalock point. These reports will be included in the subsequent SMSRs as Pfizer applies a late condition process that retrieves from the global safety database cases received but not completed in the previous months SMSR. Of these 14,527 cases, 2,098 are serious cases cases reporting Adverse Events of Special Interest (AESI) (11 % of the total downloaded cases).

Of note, whilst Pfizer are prioritising serious cases to meet regulatory compliance there are instances where due to the high case volume a small proportion of cases are not completed in time to meet the 15-day timeline. As described above, despite possible delay, all cases in the safety database are subject to Pfizer's signal detection processes and any signal would be promptly evaluated and described in this SMSR.

The root cause of late case completion is identified as the unprecedented volume of cases received consequent to the unprecedented subjects' exposure to the vaccine. Pfizer commenced a program of measures to increase PV system capacity in preparation for launch including an increase in case processing resources. Pfizer has completed the onboarding and deployment of 1700 resources into the case management systems and anticipate this number to increase to approximately 2000 within Q3 2021.

In addition, the following corrective actions have been or are being initiated to manage the volume of adverse event cases received:

(b) (4)

¹ These actions were initiated and/or completed in anticipation of an increased adverse event reporting volume.

Serious cases from all countries of incidence and those non serious cases from EEA countries of incidence only (with the exception of any retrieved by Pfizer from EVWEB) are reported into the EudraVigilance database. As of 10 Jun 2021, there were 68,112 non-serious COVID-19 vaccine cases from global sources that were still in process beyond day 90. However, of those approximately 45,000 were downloaded from EudraVigilance and nearly 17,000 from outside of the EEA and thus not required to be submitted to EudraVigilance. Similarly, as of 10 Jun 2021 there were only 430 serious cases received by Pfizer from sources other than EVWEB which require submission to EudraVigilance that were beyond day 15. As noted previously, all cases in workflow for the COVID-19 vaccine are included in signal management activities.

The MAH acknowledge the importance of including the AESIs and reports that are PRAC requests in ongoing procedures. The implemented prioritisation approach during the pandemic allows the processing of adverse events of most critical importance for signal detection and benefit/risk evaluation for the COVID-19 vaccine.

QUESTION 3

The MAH is requested to report the results of the review of Hepatic events (not only the conclusion) as this is considered a non-validated safety signal in the 5th MSSR.

Response:

Refer to [Appendix 3.4](#) for evaluation of Hepatic events.

QUESTION 4

The MAH is requested to add the results of the O/E analyses for Stress cardiomyopathy in the evaluation of the Cardiovascular AESIs.

Response:

Refer to [Appendix 5.1](#) Observed Versus Expected Analysis for Adverse Events of Special Interest.

QUESTION 5

The MAH is requested to indicate in which post-authorisation safety studies cases of Bell's palsy will be collected and analysed.

Response:

MAH is implementing several studies across EU and US to study the safety of the COVID-19 vaccine. In the EU, cases of Bell's palsy will be collected and analysed in PASS studies C4591010 and C4591021. Please note that the PASS C4591021 present in the EU-RMP version 2.1 was previously included under the name of ACCESS/VAC4EU in the EU-RMP version 1.1 and version 2.0.

In the US, cases of Bell's palsy will be collected and analysed in PASS studies C4591008, C4591009, C4591011 and C4591012.

QUESTION 6

The MAH is requested to provide a cumulative overview of cases reporting Acute disseminated encephalomyelitis (ADEM), including details of the underlying condition(s), time to onset, duration, outcome and an assessment of the causal relationship with the vaccine and a discussion on the need to update the product information, if applicable.

Response:

Refer to [Appendix 3.3](#) for evaluation of ADEM.

QUESTION 7

The MAH is requested to thoroughly discuss and justify (case definition of both observed and expected events) the used background rates in the O/E analysis for ADEM and Transverse myelitis. Note that it is not agreed to replace the background incidence for ADEM from ACCESS data to ADVANCE data just due to the low incidence rate obtained in a number of databases under the ACCESS project.

Response:

The MAH re-evaluated the background incidence rate used for acute disseminated encephalomyelitis (ADEM). In SMSR #5, a background rate of 0.1 per 100,000 person years from the ACCESS project was used, which is derived from medical records coded as ADEM only. For this SMSR, a background rate of 5.3 per 100,000 person years from the ADVANCE project, which includes a broader concept of ADEM, which also includes encephalitis, encephalomyelitis, and encephalopathy, was used. This higher background rate is justified to better align with the spontaneously reported cases, which include PT codes for acute disseminated, encephalitis, encephalopathy, and encephalomyelitis.

For transverse myelitis, the MAH has assumed the background rate as 0.35 per 100,000 person years,² consistent with the average annual rate observed for FISABIO for the 2017-2019 period. Rates from FISABIO were selected as being a conservative (i.e., lower than average) estimate among the data sources included in ACCESS that include inpatient records. Of note, the PTs used to determine cases for the numerator (the observed cases) is much broader, including MEdDRA codes for the terms myelitis transverse, myelitis, while the descriptions of codes used in the algorithm for ACCESS³ do not include any codes that reflect myelitis without being further classified as transverse myelitis.

QUESTION 8

Regarding TTS, with the exception of (b) (6), no MAH evaluation of the cases identified by the EMA Eudravigilance TTS query dated 13 April was provided in response to the previous 4th MSSR (Q8). This is not accepted. The MAH should provide an evaluation of these cases.

Response:

Refer to [Appendix 3.5](#) for Summary of Cases of Thromboembolism with Thrombocytopenia.

QUESTION 9

Pregnancy cases. It is noted that in some countries (i.e France, since the beginning of April 2021) pregnant women from the 2nd trimester of pregnancy are among the priority populations for access to mRNA vaccines against COVID-19. The MAH is requested to detail the number of ongoing pregnancies and lost-of-follow-up among the 115 pregnancies with an unknown outcome. In case of a high proportion of lost-of-follow-up, more effort should be made to improve the follow-up of women exposed during pregnancy and obtain information about the period of exposure. Data collected prospectively and retrospectively need to be presented separately. Moreover, the frequency of pregnancy outcomes should be calculated, if possible.

Response:

Refer to [Appendix 9](#) for Interval and Cumulative Review of Pregnancy Cases.

QUESTION 10

The MAH should comment on the signal of Trigeminal neuralgia identified by UMC.

Response:

² Willame C, Dodd C, Gini R, et al. Background rates of Adverse Events of Special Interest for monitoring COVID-19 vaccine, FISABIO 2017-2019. Available from: <https://vac4eu.org/covid-19-tool/>. Updated March 2021. Accessed 21 May 2021.

³ https://vac4eu.org/wp-content/uploads/2021/05/D3_ACCESS_Report_BGR_20210430_v.1.2_submitted.pdf

Trigeminal Neuralgia was reviewed and determined not to be a validated signal on 05 May 2021. This topic will be reviewed and discussed in the next SMSR #7 (covering the month of June 2021).

**ADDITIONAL QUESTION PRESENT IN THE EMA PRAC FINAL ASSESSMENT
(WITHOUT ENUMERATION)**

Closing of the signal myocarditis and pericarditis is not accepted. This signal will be further assessed in a separate procedure. However, it is observed that in 22 out of 124 cases reporting PT myocarditis and pericarditis information regarding age is lacking. This is worrisome and the MAH should increase their efforts to obtain the essential (follow-up) information in order to allow meaningful case evaluation (as general Good Vigilance Practice requirement).

Response:

The MAH acknowledges that the signal myocarditis and pericarditis is open and currently under evaluation by EMA (PRAC) and other regulatory authorities. The MAH acknowledges that quality and completeness of information obtained is important for individual case assessment and critical for signal detection and evaluation. Reports should contain information on demographics, vaccine brand, batch number, vaccination and adverse event dates, outcome, concomitant drugs, etc. Per company procedures, a minimum of 2 follow-up attempts was conducted for these non-clinical study cases.

1. INTRODUCTION

Use in pregnancy is missing information BNT162b2. The following is an interval and cumulative review of all spontaneously reported pregnancy cases received from 30 April 2021 through 31 May 2021 and cumulatively through 31 May 2021, respectively. Data is presented according to Annex 3 of the “Guideline on the exposure to medicinal products during pregnancy: need for post-authorisation data (EMA/CHMP/313666/2005)”

2. METHODOLOGY

Pfizer’s safety database contains cases of adverse events and of particular exposures that convey risk, such as exposure during pregnancy and during breastfeeding reported spontaneously to Pfizer, cases reported by the health authorities, cases published in the medical literature, cases from Pfizer-sponsored marketing programs, non-interventional studies, and cases of serious adverse events reported from clinical studies regardless of causality.

The safety database was searched for all exposure during pregnancy BNT162b2 cases reported from 30 April 2021 through 31 May 2021 and cumulatively through 31 May 2021.

The limitations of post-marketing adverse drug event reporting should be considered when interpreting these data:

- Reports are submitted voluntarily, and the magnitude of underreporting is unknown. Some of the factors that may influence whether an event is reported include: length of time since marketing, market share of the drug, publicity about a drug or an adverse event, seriousness of the reaction, regulatory actions, awareness by health professionals and consumers of adverse drug event reporting, and litigation.
- Because many external factors influence whether or not an adverse event is reported, the spontaneous reporting system yields reporting proportions not incidence rates. As a result, it is generally not appropriate to make between-drug comparisons using these proportions; the spontaneous reporting system should be used for signal detection rather than hypothesis testing.
- In some reports, clinical information (such as medical history, validation of diagnosis, time from drug use to onset of illness, dose, and use of concomitant drugs) is missing or incomplete, and follow-up information may not be available.
- An accumulation of adverse event reports does not necessarily indicate that a particular adverse event was caused by the drug; rather, the event may be due to an underlying disease or some other factor(s) such as past medical history or concomitant medication.

3. RESULTS

Interval Results (30 April 2021 through 31 May 2021):

- Number of pregnancy cases: 330 (0.7% of the total 47174 cases from the post-authorization dataset, as compared to 0.6% in the previous interval). These 330 cases

represent 317 unique pregnancies (2 cases, a mother case and a foetus/baby case) were created for 13 pregnancies).

- Country of incidence: US (88), UK (74), Germany (41), France (23), Italy (22), Israel (10), Spain (8), Brazil (7), Canada, Denmark, Ireland, Portugal (5 each), Estonia (4), Australia, Belgium, Mexico, Sweden (3 each), Hungary, Japan, Malaysia, Netherlands, Norway, Romania, Uruguay (2 each), and 7 other countries reported 1 case each.
- 128 cases reported exposure to vaccine in utero without the occurrence of any clinical adverse event. The pregnancy exposure events coded to the PTs¹ Maternal exposure during pregnancy (80), Exposure during pregnancy (42), Maternal exposure before pregnancy, Maternal exposure timing unspecified, (3 each), and Paternal exposure timing unspecified (1).
- 185 mother cases, 40 non-serious and 145 serious, reported additional clinical events, which occurred in the vaccinated mothers. Pregnancy related events reported in more than 1 case coded to the PTs Abortion spontaneous (52), Abortion missed (7), Foetal death (5), Abortion, Abortion threatened, Ectopic pregnancy, and Gestational diabetes (2 each). Other clinical events which occurred in >5% of these cases coded to the PTs Fatigue (22), Headache (21), COVID-19 (12), Myalgia (11), Chills, and Pyrexia (10 each).
- 17 serious foetus/baby cases were reported.
 - Five (5) of these cases reported 7 congenital anomalies that coded to the PTs Anencephaly, Cleft palate, Congenital absence of cranial vault, Congenital anomaly, Foetal cystic hygroma, Spine malformation, and Trisomy 21. The age of the mothers in these 5 cases ranged from 26 to 41 years. Trimester of exposure was reported for 2 cases as 1st trimester and was not reported in the remaining cases. Pregnancy outcomes were spontaneous abortion, elective termination with foetal defects (1 each) and in the other 3 cases pregnancy outcome was unknown at the time of reporting. Concomitant medication was provided for 1 case and included clomifene. There were no co-suspect medications reported.
 - Clinical adverse events reported in the other 12 cases coded to the PTs Foetal growth restriction, Premature baby (5 each), Cerebrovascular accident, Death, Foetal death, Foetal heart rate abnormal, Foetal heart rate disorder, Meconium aspiration syndrome, Neonatal respiratory acidosis, Premature separation of placenta, and Umbilical cord thrombosis (1 each). Trimester of exposure was reported for 8 cases: 1st trimester (3), 2nd trimester (1), and 3rd trimester (4). Pregnancy outcomes were live birth (6)², spontaneous abortion (2), stillbirth with foetal defects, elective termination with foetal defects, stillbirth, and not provided (1 each). Concomitant medications were provided for 6 cases and included crisaborole, loratadine, estradiol, progesterone, diphtheria/pertussis/tetanus

¹ One case reported 2 exposure PTs.

² One case reported live birth of premature baby that died 2 hours after birth.

vaccine, paracetamol, vitamins/minerals, folic acid, omeprazole, and sertraline (1 case each). There were no co-suspect medications reported.

- Of the 330 cases, 87 provided pregnancy outcomes which are provided [Table 1](#) below. Pregnancy outcome was pending or not provided in the remaining 243 cases.

Table 1. Summary Table of Pregnancy Outcome for the Interval 30 April 2021 through 31 May 2021

Pregnancy outcome	Prospective cases Number (% of pregnancy cases)					Retrospective cases Number (% of pregnancy cases)				
	Timing of exposure in pregnancy					Timing of exposure in pregnancy				
	Before conception	1 st trimester	After 1 st trimester	During all pregnancy	Unknown	Before conception	1 st trimester	After 1 st trimester	During all pregnancy	Unknown
Ectopic pregnancy	0	0	0	0	2 (0.6%)	0	0	0	0	0
Spontaneous abortion	0	6 (1.8%)	2 (0.6%)	0	25 (7.6%)	0	15 (4.5%)	2 (0.6%)	0	14 (4.2%)
Elective termination (foetal defects)	0	2 (0.6%)	0	0	1 (0.3%)	0	1 (0.3%)	0	0	0
Elective termination (no foetal defects or unknown)	0	0	0	0	0	0	0	0	0	0
Stillbirth with foetal defects	0	1 (0.3%)	0	0	0	0	0	0	0	0
Stillbirth without foetal defects	0	0	0	0	2 (0.2%)	0	0	0	0	3 (0.9%)
Live birth with congenital anomaly	0	0	0	0	0	0	0	0	0	0
Live birth without congenital anomaly	0	0	1 (0.3%)	0	2 ^a (0.2%)	0	0	6 (1.8%)	0	2 (0.2%)
Total	0	9 (2.7%)	3 (0.9%)	0	32 (9.7%)	0	16 (4.8%)	8 (2.4%)	0	19 (5.8%)

a. Includes 1 case that reported live birth of premature baby that died 2 hours after birth.

Cumulative Results (through 31 May 2021):

- Number of pregnancy cases: 1036 (0.6% of the total 167,956 cases from the post-authorization dataset). These 1036 cases represent 995 unique pregnancies (2 cases [a mother case and a fetus/baby case or 2 mother cases for each dose] or 3 cases [a mother case and 2 fetus/baby cases for twins] were created for 40 pregnancies).
- Country of incidence: US (326), UK (245), Germany (86), Italy (52), Canada (46), France (38), Israel (26), Spain (23), Portugal (22), Mexico (20), Netherlands (18), Ireland (17), Estonia (12), Hungary (9), Brazil, Denmark, Poland, Romania (7 each), Greece (6), Belgium, Norway (5 each), Japan, Sweden (4 each), Australia, Czech Republic, Latvia, Malaysia, Slovakia (3 each), Austria, Chile, Finland, Iceland, Puerto Rico, Serbia, Singapore, Turkey, Uruguay (2 each), and 11 other countries reported 1 case each.
- 413³ cases reported exposure to vaccine in utero without the occurrence of any clinical event. The pregnancy exposure events coded to the PTs Maternal exposure during pregnancy (274), Exposure during pregnancy (115), Maternal exposure timing unspecified (13), Maternal exposure before pregnancy (7), Foetal exposure during pregnancy (2), and Paternal exposure timing unspecified (1).
- 582 mother cases, 146 non-serious and 436 serious, reported additional clinical events, which occurred in the vaccinated mothers. Pregnancy related events reported in more than 1 case coded to the PTs Abortion spontaneous (186), Abortion missed (19), Foetal death (13), Abortion (6), Ectopic pregnancy, Gestational diabetes, Premature labour (4 each), Pregnancy with contraceptive device, Stillbirth, Uterine contractions during pregnancy (3 each), Abortion threatened, Anembryonic gestation, Foetal hypokinesia, Haemorrhage in pregnancy, Postpartum haemorrhage, Pre-eclampsia, Pregnancy, Premature delivery, Premature rupture of membranes, and Preterm premature rupture of membranes (2 each). Other frequently reported (>3% of cases) clinical events coded to the PTs Headache (95), Fatigue (77), Vaccination site pain (58), Pain in extremity (56), Pyrexia (46), Chills (45), Myalgia (41), Pain (37), Nausea (32), Arthralgia, Dizziness (25 each), Lymphadenopathy (22), COVID-19 (20), and Vaginal haemorrhage (18).
- 41 fetus/baby cases (40 serious, 1 non-serious) were reported.
 - Ten (10) of these cases reported 12 congenital anomalies that coded to the PTs Anencephaly, Foetal cystic hygroma (2 each), Cleft palate, Congenital absence of cranial vault, Congenital anomaly, Ductus arteriosus premature closure, Foetal malformation, Spine malformation, Syndactyly, and Trisomy 21. Other clinical events reported in these cases coded to the PTs Neutropenia neonatal, Ventricular hypertrophy, Pulmonary arterial pressure abnormal, Foetal death, Foetal movement disorder, and Foetal heart rate abnormal (1 each). The age of the mothers in these 10 cases ranged from 21 to 41 years. Exposure occurred during the 1st trimester (4 cases), 3rd trimester (1 case), and in 5 cases this information was not provided. Pregnancy outcomes were reported as spontaneous abortion (3),

³ An exposure term was not coded for all cases.

stillbirth with foetal defects, elective termination with foetal defects (1 each), and unknown at time of reporting (5). Concomitant medications were provided for 3 cases and included folic acid, clomifene, and levothyroxine (1 case). There were no co-suspect medications reported.

- Clinical events reported more than once in the remaining 31 foetus/baby cases coded to the PTs Premature baby (13), Foetal growth restriction (9), Foetal heart rate abnormal (3), and Foetal death (2). Trimester of exposure was reported for 16 cases: 1st trimester (9), 2nd trimester (1), and 3rd trimester (6). Pregnancy outcomes were live birth (12)⁴, spontaneous abortion (6), stillbirth, elective termination with foetal defects, stillbirth with foetal defects (3 each), and in 4 cases the pregnancy outcome was not provided. Concomitant medications were provided for 12 cases and included folic acid, vitamins/minerals (4 cases each), paracetamol (3 cases), sertraline, acetylsalicylic acid, omeprazole (2 cases each), acetylsalicylic acid, dalteparin, influenza vaccine, ibuprofen, temazepam, cetirizine, calcium, calcium carbonate, fluticasone, triamcinolone, ergocalciferol, crisaborole, loratadine, estradiol, progesterone, diphtheria/pertussis/tetanus vaccine, and omeprazole. There were no co-suspect medications reported.
 - Of the 1036 cases, 288 provided pregnancy outcomes which are provided in [Table 2](#) below. Pregnancy outcome was pending or not provided in the remaining 748 cases.
 - *EMA PRAC assessment report (Product No. EMEA/H/C/005735/MEA/002.4) received on the fifth SMSR, stated that in some countries (i.e France, since the beginning of April 2021) pregnant women from the 2nd trimester of pregnancy are among the priority populations for access to mRNA vaccines against COVID-19. The MAH is requested to detail the number of ongoing pregnancies and lost-of-follow-up among the 115 pregnancies with an unknown outcome. In case of a high proportion of lost-of-follow-up, more effort should be made to improve the follow-up of women exposed during pregnancy and obtain information about the period of exposure.*
 - The MAH reviewed these 115 pregnancy cases to determine if follow-up information has been received and pregnancy outcome provided. On review, 3 of these cases were made invalid and 3 other cases received follow-up information that provided pregnancy outcomes that included a post-mature birth of a normal foetus, an elective termination, and a spontaneous abortion. Of the remaining 109 cases, 26 cases provided the trimester of pregnancy. Based on the date the report was received and the trimester of exposure, 25 of these pregnancies are most likely still ongoing. In the remaining case, follow-up was recently requested.
- For all the remaining cases that did not provide trimester of exposure, the MAH is attempting follow-up activities as per current procedures. The MAH attempts to obtain follow-up on all pregnancy cases are performed within 10 days of the safety received date, then 20 days after the 1st follow-up attempt has been made,

⁴ Two (2) cases reported a live birth; however, the babies died (one the following day and the other 2 hours after birth).

and if the pregnancy is ongoing, 2 additional attempts are made after the expected date of delivery or 9 months after the receipt of the initial report if the expected date of delivery is unknown.

Table 2. Summary Table of Cumulative Pregnancy Outcomes through 31 May 2021

Pregnancy outcome	Prospective cases Number (% of pregnancy cases)					Retrospective cases Number (% of pregnancy cases)				
	Timing of exposure in pregnancy					Timing of exposure in pregnancy				
	Before conception	1 st trimester	After 1 st trimester	During all pregnancy	Unknown	Before conception	1 st trimester	After 1 st trimester	During all pregnancy	Unknown
Ectopic pregnancy	0	0	0	0	3 (0.3%)	0	1 (0.1%)	0	0	0
Spontaneous abortion	1 (0.1%)	45 (4.3%)	2 (0.2%)	0	78 (7.5%)	1 (0.1%)	46 (4.4%)	4 (0.4%)	0	45 (4.3%)
Elective termination (foetal defects)	1 (0.1%)	4 (0.4%)	0	0	2 (0.2%)	0	2 (0.2%)	0	0	0
Elective termination (no foetal defects or unknown)	1 (0.1%)	0	0	0	1 (0.1%)	0	0	0	0	1 (0.1%)
Stillbirth with foetal defects	0	1 (0.1%)	0	0	1(0.1%)	0	0	0	0	2 (0.2%)
Stillbirth without foetal defects	0	0	0	0	2 (0.2%)	0	2 (0.2%)	1 (0.1%)	0	7 (0.7%)
Live birth with congenital anomaly	0	0	0	0	0	0	0	0	0	0
Live birth without congenital anomaly	0	2 (0.2%)	7 (0.7%)	0	7 ^a (0.7%)	0	1 (0.1%)	7 (0.7%)	0	10 ^b (1.0%)
Total	3 (0.3%)	52 (5.0%)	9 (0.9%)	0	94 (9.1%)	1 (0.1%)	52 (5.0%)	12 (1.2%)	0	65 (6.3%)

a. One case reported live birth of premature baby that died 2 hours after birth.

b. Three (3) cases reported live births; however, the baby died the following day. These cases are potential duplicates and may only represent a single pregnancy.

4. CONCLUSION

Cumulatively a total of 995 unique pregnancies were reported, 317 of which were received during the reporting interval.

Overall, the majority (763) of these cases had insufficient information to conduct a meaningful medical assessment of causality (eg, concomitant medications, trimester of exposure, pregnancy outcome, medical history). Of the 1036 cases reported cumulatively, 478 were assessed as serious. The most frequently reported pregnancy related events in these cases coded to the PTs Abortion spontaneous (187), Abortion missed (19), Foetal death (16), Premature baby (13), Foetal growth restriction (10), and Abortion (6).

The review of the cases indicative of drug exposure during pregnancy did not reveal any new safety information.

Whether the frequency of pregnancy outcomes, pregnancy related events, and newborn events is consistent with expectation cannot be evaluated based on the spontaneous reports. The number of pregnant women who have received the COVID-19 vaccine is unknown. There is limited experience with use of Comirnaty in pregnant women. Animal studies do not indicate direct or indirect harmful effects with respect to pregnancy, embryo/foetal development, parturition or post-natal development. Administration of Comirnaty in pregnancy should only be considered when the potential benefits outweigh any potential risks for the mother and foetus.

The MAH is conducting study C4591015 to study the safety of Comirnaty in pregnant women – this study is conducted as a committed Post-Authorization Safety Study. Other Post-Authorization Safety Studies planned or being conducted may inform regarding pregnancy.
